3321. FS: Radio Engineer's Handbook, by Terman.

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-10 00:00:00 UTC
From: Ed Sieb <va3es@rac.ca>
Message-ID: <TQ1M3.6167$up3.6524@news21.bellglobal.com>
Source record: 66471

Hi All,

I have for sale, Radio Engineer's Handbook, by Frederick Terman, 1943.
This copy is in good condition, 7.5 out of 10. Binding is very good,
covers are very good,
but there is "softness" on the corners of the covers (slightly dog-eared).
I'm asking $15.,
including shipping in North America.

73,

Ed

I'm still looking for a winter project, I want a HF console amp, or a 2 piece unit, that is broken, burnt-out, "zapped", etc. ie. Henry, BTI, DrakeL7, LK-550, etc.
Send me a message, let me know what you have, we'll work a deal.

I had a security goon ask me to dis-assemble a scope once..
I had to escalate to the second layer of security people before I got loose
of that one.

I can't talk about the Small Wonders kit (although I'd love to buy one and build it), I can talk about the Ten Tec kit. Nice kit, but some flaws:

It's kinda current hungry, not a problem for home operation but a consideration for backpacking (it's also rather large).

Only has 70kHz of tuning; the Small Wonders DSW should have full band coverage.

The Ten Tec kit has no reverse battery protection: important to add if you're a klutz like me!

Also, the kit inludes solid strand wire for building; I broke 'em several times while building and finally replaced all the wire in the kit with some cheapo mulitstranded wire (for wiring the power switch, speaker, etc).

Other than that, I can't really comment on either kit. Any feedback on the Small Wonders kit?

It does.

>you're a klutz like me!

The DSW has a series diode on the DC input for reverse-polarity
protection.

>

The DSW has a built-in iambic keyer and morse readout of the frequency.
There are ribbon cables (which plug into the board) for the connections.

Hi and thanks for reading.

I am looking for the following air variables:
Johnson #154-11, which is a 9~38pf 3kv or higher variable
Johnson #154-1, which is a 12~244 pf.

Could be reasonable subs.

Thanks,
Bennett ko2ok in NJ

Most of the time it was no problem for me, even on international flights.

Probably the most exasperating one was flying out of indianapolis a week after TWA 800 went down. I was in fact connecting to TWA 800 to Paris. When they xrayed my briefcase, they went to a hand search, disorganized all my notes, riffled through everything in the bottom, and told me to go on. I stood there for a while putting everything back in order, and happened to open one of the two pencil compartments built into the case. The security fellow commented "I thought I saw something in there, but I didn't know what it was".... ISNT THAT THE WHOLE POINT???

They had already cleared me though, and I could just as well have been carrying bricks of C4 in there for all they knew. They saw something "suspicious" in my bag, but let me go with it anyway!...

If they're going to put me through the inconvenience, I'd appreciate it if they took it seriously. China Air would never have done that. They damn well would have made sure they understood what it was, and that it was harmless.

I don't mind the inspections, just the stupidity.
I've carried a lot of prototypes through a lot of airports.

That's probably the norm. I'd be willing to bet
that the security people at nearly all US airports
are paid just the same as a security guy at a
discount store - not very much. You get what you
pay for, and you can't substitute technology for
intelligence.

Hi,

here's a question I hope someone can help me with! I have a homebrew 20W HF Amp running off 14 volts. When I transmit a 2 tone signal (or any signal for that matter), should I see evidence of that signal across the power supply?

Measurements done with the amplifier terminated in a dummy load show 1v peak to peak of the 2 tone signal across the power supply terminals.

Regards,
Richard VK5OO

Has anyone disassembled the DSP firmware in the RX-320 receiver? It seems that this little gem is a treasure trove of potential waiting for third party developers to get into it and add functions. I know that Tentec has opened the control interface, but this only let's you get so far. It would be great if the memory map and firmware source were available.

You should not see any signal on the power supply. It should be almost pure DC. You are probably either picking the signal up with the measuring device or the supply is loosing regulation. Maybe it just needs a bigger or more bypassing of the output.

I had an older reciever with a bad channel too, took it to the local
repair guy, he replaced a 50 cent transister in a preamp stage, and I
now have a great 250 watt pioneer stereo.
Before you trash it, find what is fried, it might be worth repairing.
You can always sell it when you are done.

That amount of signal on the power supply isn't too bad. It would be better if it were down to, say, 0.1 V p-p, which you should be able to achieve with careful lead dress and shielding of the power supply, as well as filtering at both the power supply and load connections of the 14 Volts.

3346. Jones Plug for Metron amp ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-11 00:00:00 UTC
From: Philip de Cadenet <BigMobile@invest.fsbusiness.co.uk>
Message-ID: <lPZ3RDAUJaA4EwcB@invest.fsbusiness.co.uk>
Source record: 66483

I'm looking for a source of Jones plug's.

I need one to make up a remote head unit for a Metron solid state HF amp.

I've had no joy with my search engines on the net.

Can anyone suggest a possible source?

Mny tnx

Phil

>
Depen the frequency of the crystal assume 15MHz then a 5 to 25pF varicap
in series crystal will pull perhaps 70ppm = 1kHz your problem you need
to pull +-5kHz. If you are careful with the design and tune out some of
the static capacitance across the crystal you could approach 1000ppm ie
10kHz.
Note overtone ie xtals over 20mhz wont pull this much.
Also crystals that are small and under 5MHZ also wont pull.
Ceramic resonators will pull a lot more but are not so stable.

3348. TRADE: Telex headset

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-12 00:00:00 UTC
From: Ron Angle K6KYJ <k6kyj@hotmail.com>
Message-ID: <d1BM3.211$RA.1973@news2.randori.com>
Source record: 66398

Am looking to trade a new (10 hours use) Telex Contester headset/boom mike for a similar headset with a high impedance audio output (50K) mic element. Will trade for an older, used headset if it still has good audio quality.

If anyone has any experience adapting a low impedance headset for high K inputs (e.g. Kenwood TS-820), please email.

Email to: K6KYJ@hotmail.com or address on header. Would like to get this resolved by the ARRL 10m contest.

K6KYJ...Colusa Co. for the 1999 CQ-P

Some years ago we visited the land of hope and glory, USA.

Except for the usual stuff, electronic gadgets, I brough with me a soft-ball bat. My friend had a number of ceramic coffee mugs.....

OK so we come to the security gate and wow what a reation, when I put the bat on the conveyor belt the security guy reacted just as if I had hit him on the head!!! "Hey whats this? A base-ball bat??"
"GUARD!!!!!"
The guard came and picked me and my bat up and after the usual explenation (to big to be checked luggage), I was forced to make a gate check in, handling the bat to the stuardess. This was on the domestic flight from Boston to NYC. Changing to international i NYC I expected the very same thing to happen, and yes the security guy reacted almost as the one before, with the exception, instead of yelling for the guards, he asked me for my flight number. When I revealed it was SKxxx he said " Oh what the heck take it and leave!" I wonder what the reaction would have been if I had said EL-AL???

My friend with the mugs? Oh they though it was hand-grenades.... big confusion for a short moment..... BIG fun!

My second fight with security was during the Iraqi-conflict, and I was travelling from Munich Germany. I had brought a hobby 12 volt miniture hacksaw. I also had my small Minox camera. As usual my bag was shockfull with components and other junk as well. Passing security, they DEMANDED that I took my miniature Minox apart and removed the film (SIC), they x-rayed my bags and was shocked to see the saw. "Run it" they said. "I can not" I replied and pointed to the box which said battery operated hack saw. Well they gave me an ulitmatum: Either you show that the thing operates or throw it away OR leave the queue and send it home with normal mail. Having spent 50 DM on the darn thing I leaft and went to the post office. This set me back another 30 DM.... upon returning to the queue I once again had to open my miniature camera..... So whats my complaint? Well security IS GOOD if it works! I could have brought any "detonator" made up with my electronic junk in my bag! I could take any transistor radio (think of Lockerbie) as long as it did operate .... I found the whole geman security process a joke!!!

Finally, a few years ago visiting London I was fortunately enough to win a nice LogiKey CW keyer. This went into my checked luggage (Germany still in fresh memory), and when checking-in the desk clerk asked me if there was any electronic stuff in my bags, and I replied with yes. A guard was called and he carried my luggage to a special x-ray machine, gave it a hard look, carried it back again and with a

smile wished me a happy journey! What a difference....

Cheers

Harry's Homebrew Homepage is lcated at:

http://sm0vpo.8m.com/
http://www.geocities.com/SiliconValley/3569/
http://hem2.passagen.se/sm0vpo
http://members.xoom.com/sm0vpo

There you will find loads of projects documented projects including antennas, transmitters, receivers, PSUs and many many usefull circuits. PCB foil patterns are included for many projects and there are even photograph illustrations of the more recent projects.

I have recently included loads of freeware and shareware software packages for PCB drafting in the DOWNLOADS section. All the more recent PCB component layouts and PCB-foils are in BMP format so that everyone can read and print them (they are zipped).

Amongst the more recent projects added to the page are:
- TBA120 NBFM receiver - 100KHz to 100MHz, change two coils & crystal.
- Simple 4-watt AF amplifier - much better than the LM380.
- Extending the Balcony Antenna using Fractal & Meander principles.
- VHF digital direction finding system.

The site is well worth a visit. I hope you have fun - Harry SM0VPO

3351. Download problems

I have had loads of E-mail because the DOWNLOAD pages frequently give the error message FORBIDDEN when trying to get a ZIPped PCB foil pattern or datasheet from my homepage. Harry's Homebrew Homepage is lcated at:

http://sm0vpo.8m.com/
http://www.geocities.com/SiliconValley/3569/
http://hem2.passagen.se/sm0vpo
http://members.xoom.com/sm0vpo

The Passagen and Xoom sites (for Europe and the far East) have recently added banners to the INDEX file. When you click on another site (example http://sm0vpo.8m.com) then these servers import the files to their own server. Great! it's all free, but if you try to download a PCB foil pattern ZIP file you are accessing the site from an external site! This results in the message FORBIDDEN!!

If you want the PCB foils then copy (Ctrl+C) the URL and paste into the ADDRESS panel of your browser (Ctrl+V) and it will load the original site. You can then download to your hearts content.

I hope you have fun - Harry SM0VPO

Dear Newsgroup,

I have recently come across a Triplett Model 3490 Transistor Analyzer.
This is a fascinating peice of equipment that I do not plan on
selling. It appears to be in working order with only minor cosmetic
flaws. However, If anyone has any information on what the value might
be for insurance purposes, or any information on different uses for
this equipment, I would really appreciate it.

Thanks,
Mark

3354. Coils - sockets - Denco?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-12 00:00:00 UTC
From: Harry - SM0VPO <harryvpo@hotmail.com>
Message-ID: <38032B5C.8340D142@hotmail.com>
Source record: 66404

Hi,

I have produced a few constructional kits but have avoided coils like the plague, mainly because they cost the earth. this means that I have had to stay clear of HF projects. I can make coil formers dead-easy myself, but if someone else wants a kit they don't want to bugger around with sawing their way through plastic tubes and using copious quantities of superglue.

Does anyone know of a good CHEAP source of ready-made plug-in coil formers? What I need is something that is cheaply available I can use to fit a custom-designed a PCB. There used to be a source of DENCO plug-in coils but I cannot find them anymore. I know that DENCO products were taken over by another company who produced the same ready-wound coils, but even they have dissapeared into antiquity.

Best regards from Harry - SM0VPO

A while back, I heard that someone, perhaps on the west coast, was looking for FT-243 crystal holders. The fellow was making new elements for them for the ham bands, but he needed more of the empty holders. I have a whole bag of them (probably 2 or 3 dozen) that I will part with. Anyone know who that guy was???

Source record: 66406

If you want to cannibalise the set and use the transformer, then take a moment to identify the mains input terminals. Easy to follow from the mains wiring. Stuff a few volts of low-frequency AF into that winding and look at the other windings with an oscilloscope. Measurements with an ohm-meter will identify windings and the scope will give you an indication of the output voltages.

Finally, connect the AF source to the largest secondary and repeat. If you get almost the same figures then you have confirmation. If the figures are widely different then the transformer could be stuffed. Connect it to the mains in series with a mains light-bulb, if you want to go-ahead, just in case it is the transformer that was really knackered. if the bulf lights up then either throw the transformer away, use the former for winding your own transformer or send it to me.

Measure the mains leakage to the secondaries, reverse the primary connections and measure the leakage again. Many old radio sets are left outside or in damp sheds where the transformers become nicely moist and which can cause dangerous leakage between primary and secondaries. If there is bad leakage, then either throw the transformer away, use the former for winding your own transformer or send it to me.

Best regards from Harry - SM0VPO

3357. Re: pulling a crystal off frequency

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-12 00:00:00 UTC
From: Harry - SM0VPO <harryvpo@hotmail.com>
Message-ID: <38033456.7FEC4E@hotmail.com>
Source record: 66407

Not as much as you want - If you take a basic crystal-colpits oscillator at, say, 7MHz then adding parallel or series capacitance would probably lower or increase the frequency by +/- 5KHz.

If you were to insert a large inductor (30-turns) and a capacitor (100pf) in series with the crystal then you would be able to pull the crystal by up to 20KHz or more. The practical limit is where the oscillator either stops or the stabalising effect of the crystal is destroyed. this occurs with too much inductance and mazimum capacitance (all in series). this technique was used by MIZUHO who manufactured a VHF SSB rig many years ago. Each band covered a 200KHz section of the 144-145MHz band.

Another technique is to multiply the "pulled" crystal (eg. 8KHz as above) by, say, 18 so the output is in the VHF spectrum. Then heterodyne the result with another multiplied crystal oscillator pulled in the opposite direction. This could give you a dual crystal HF VFO with a shift of up to 300KHz or more.

Yet another technique is to use two similar crystals spaced apart in frequency by, say, 10KHz; the two crystals in parallel and in series with a 33pf variable capacitor. Providing the two crystals have aproximately identical activity then you can get a larger pulling effect.

I also read that an Australian chap used two high-HF band fundamental crystals of quite different frequencies which both oscilated in the same single-transistor circuit. By pulling one of the crystals the heterodyne changed, more than just a single low-HF band crystal.

Ok then Jim, there are a few ideas for you to begin experimenting with. I hope that you will post your findings here if you should have any positive results as this is quite an interesting homebrew subject.

I once went to Saudi from Thiefrowe (UK) with an inverter. Gave 220-volts AC out for 12-volts in. It was only 50-watts to power my CD player and a few other small items. Problem was, the transformer was a torroidal jobbie for efficiency. This transformer was bound in that brown-varnished tape and the wires were neatly soldered to a PCB. No case, box or cabinet, just laying flat in my briefcase.

I had a hell of a job getting through the X-ray. They shut down one of the machines, made me open the case myself and put the thing in the machine. Did you know that they can blow the picture right up so that you can see all the windings?

****** Please reply by e-mail *********
I have an autopatch that I am trying to get working. I had been using it for some time but noticed that, while all rigs could access the patch, very few rigs' DTMF were recpgnized by the phone company for dialing. I played with the audio levels and adjustements to no avail.

I have been using the audio from the speaker jack up to now, but I heard that I should be using the audio from the demod before it has been de-emphasized. OK, so I have that avail, but there is no squelch and there is a LOT of high freq. audio hash as well (besides the sig. level is too low as well).

I need an authoritative answer as to how to connect my autopatch to the rig so that it works. I am using an IC-28A (ICOM) xcvr and a Teleconnect 851 autopatch.

Thanks in advance.

Ten 5-pins, six 4-pins. Phenolic or wafer is okay, except
at least some of the five-pins ought to be ceramic.

Please email WA6QPL@amsat.org if you can help.

Money cheerfully offered. Well...willingly, anyway.

3370. "Homebrew" stuff for senior/disabled hams...

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-12 00:00:00 UTC
From: wn8mea <wn8mea@hotmail.com>
Message-ID: <5TPM3.8693$%62.147882@c01read02-admin.service.talkway.com>
Source record: 66420

One of the main reasons I started DWM Communications over a decade ago, was because of several disabled and senior citizen hams who approached me and asked me to build simple projects for them. Some told me they had poor eyesight or arthritis. Others told me that the nursing home or the family they were living with wouldn't allow them to use soldering irons.

So I came out with a little sideline business to sell ASSEMBLED "homebrew" products at VERY inexpensive prices. In fact, many of the devices are cheaper than most kits!

If you're interested in checking out some active antennas, antenna tuners, QRP xmitters, etc., I invite you to my new website at:

Subject: ** FLEA at MIT ** Sunday August 15th Cambridge MA
Summary: Buy Sell SWAP Ham Radio Electronics Computers 9AM - 2PM

This coming Sunday ... The Seasons LAST...

*** !!!! In our Traditional GARAGE and lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday, October 17th 1999
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776

On the QRP-ARCI list, the DSW is the winner, no questions asked.

It's an excellent value, relatively easy to build, and a top performer.

Yes. Go to your local sporting goods store and look for woven dacron fishing line. I use Gudebrod #518 almost universally. If you only need enough for one project, send me your address and I'll mail you some - no charge. (The normal pack is 100 yards for about $5.00, so you get enough to last for years.)

No specifics but...

my bet would be on a bad electrolytic capacitor.

Does the monitor make clicking noises when you switch resolutions?
(does it sound like there's a relay involved?) If so, I would find the
relay on the circuit board & start with capacitors located near the
relay. A capacitor checker would be VERY valuable (borrow one if you
have to) as often I've seen electrolytics lose most of their value with
no externally visible symptoms. (the first time I measured a 100uF cap
and saw 230pF on the meter, I thought I didn't know how to operate the
meter!)

Hello all,

I have Hewlett Packard 8410C/8412B/8411A opt. 018 Vector Network Analyzer systems for sale. These are late model, in excellent condition and are functionally checked and appear to be in calibration. There are no cables or accessories but I will include part of the operating section of the 8410B manual.

I have already sold several of these and could provide references to the condition of these units from happy customers.

I am asking $650 plus shipping which is about 1/10 of what Tucker sells them for. They are tested so it is not like buying at a flea market; you don't get a current calibration sticker though.

I also have some older 8410B/8412A/8411A which would be less expensive. I also have some that have cosmetic damage but are working and I would take less for one of these. Tell me what your are interested in.

If you get back to me quickly with a verbal commitment I can throw in a 8750A storage normalizer
tested but no interface cable.

Thanks for reading this.

3386. Re: cascode rf amp

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-13 00:00:00 UTC
From: Ralph Mowery <rmowery@dialpoint.net>
Message-ID: <3804DBDE.80EF3B52@dialpoint.net>
Source record: 66346

The J310 has a noise figure of around 1.5 to 2 db in the 6 meter band depending on the device and IF it matched (mismatched may be moer like it) to the antenna. Don't recall the gain in anything but one fet in the grounded gate mode, but it is around 10 to 15 DB so your 35 for the two in the cascode circuit is probalby in the ballpark.

Not to discourage the expirmenting,but the newer gasfets are capabile of under 1 db at 6 meters and up to 432 mhz in simple circuits with gains of 20 db or more. Look at a Motorola MRF 966 gasfet and the designs inthe ARRL handbook. They are just about as cheap as two of the j310s.

My personal favorite in 60s transistors that I could afford was the 2N170.
You could actually get these babies to oscillate at 1.5 Mhz.

CK722s.
I had a few of these when I was a kid. I don't miss 'em. They were noisy
and expensive compared to the cheapest device available now.
Ditto the 2N107.

When we wanted to build something that would work, we used dual triodes from
old computer modules. They were pin compatible with 12AX7 and 12AU7. They
were just about free, and worked a whole lot better than the "hobby"
transistors I could obtain.

This old guy doesn't miss the "good old days."

My experience has been that most of the car remotes are RF at around 400MHz. There are chipsets for 300,400 and 900Mhz bands from quite a few vendors. RF Microdevices, Linx (www.linx.com), and a few others that I can't readily remember. Linx sells complete modules, ready for an antenna and data input/output.

RFM makes some modules, 303.875 and 315 MHz are typical for this application... Thier ASH receiver is prone to blockage by signals on adjacent channels... They may have overcome that problem by now.. These are just the RF parts, you supply the encoding/decoding. Both parts run off of 3VDC.

But can't you get by with something homemade?

A toroid and a trimmer should work fine, and a toroid is self-shielding.

Or dig up an old IF transformer and put your own coil in it. Old tube
era transformers have the advantage of plenty of room, but people have
rewound 10.7MHz If transformers for other points in the HF spectrum.
The core might not be too useable that much lower. Maybe a 4.5MHz
transformer, from a TV set, might have a more adaptable core. If
you just use the IF transformer case, you could use some other coil
and fit in a trimmer capacitor to get it exactly on frequency.

Another possibility might be the oscillator coil from an AM broadcast band
radio. They must be around the right frequency. Some of them at least
have a few turn secondary winding for coupling into it. You could
pull it out of any "transistor radio".

Gosh, what a bunch of old guys!

Well, I used to buy CK722's in that world famous dark blue case too,
but I don't remember what they sold for in the early '60's. Seems to
me it was in the $3 range (a fortune for my budget as I recall.)

I tried to dig out the ceramic around the leads I broke off in order
to solder in a replacment. It sort of worked, sometimes, if no
further stress was put on the lead (meaning no more using it in
more than one project.)

By the way, just have to mention, I have a brand new, never been
used RCA 2N34 in the paper bag with the built in snap closer.
I never used a 2N34, but came across this one about 30 years ago
in some surplus/junk bag buy. Might need it someday...

I've been playing around with an old circuit and wondered if anyone could give me a ball park noise figure. I have no way to measure it. It's a 2 FET (J310) cascode (Wallman configuration). The first half is a neutralized common source and the last a common gate. Gain at 50 Mhz is 35 db at 13.6 volts. This configuration was popular in the '60s. Any ideas?

Summary: Buy Sell SWAP Ham Radio Electronics Computers 9AM - 2PM

This coming Sunday ... The Seasons LAST....

*** !!!! In our Traditional GARAGE and lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday, October 17th 1999
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

Source record: 66428

HI
I just found a scrapped NEC Multisync 3FG, a great monitor when it works...

The monitor gives excellent picture at 640x480.
Switching to 800x600 gives either loss of sync or a dark picture that is half the size of normal. Tweaking sync adjustment shows that something happens but only way to get sync back is to switch monitor off/on. Picture is still small when sync is lost.

If anyone have an idea what to look for please let me know.... have no schematics

/Lasse SM5GLC

<< lots of FUN (?!?) stuff deleted >>

Two years ago I took my Kenwood TS711 (2m allmode station) with me to work /MM on a sailing trip.
In Zurich they simply used a GC to search for nitrogene, a painless two minute procedure.
On the way back we checked in in Athens, Greece. The whole thing was just a big joke. I put my rig on the X-ray machine and observed the security guard who dozed behind his screen. When the rig came across he suddenly woke up, turned the machine to maximum to get through all the metal (there's quite a lot in the TS711...) and -- continued dozing. I did not have to prove it worked, nothing.
Right after that I could get a look at the screenshot he took from the rig: the mains transformer was just a black donut, all the rest was more or less transparent.
I am shure, that it would be an easy job to replace the iron core with an iron ring filled with explosives, some work, ok, but nobody would notice later on the airport, except they search for nitorgene, as in Zurich. The guy in Athens simply did not care and *this* is IMO the main problem. If security is not taken serious (and this also means well trained and well paid staff), all that security stuff is worthless.
IMHO the only secure way is to use the (still rather expensive) GCs I have seen in Zurich (and Frankfurt, LAX). This would also make it an easy job to carry homebrew equipment with You. If they don't find nitrogene, there is no explosive in it and they should be happy.

At Dayton, I tried to convince the president and sales manager to publish the DSP code as open source. They politely said no, they would not publish the DSP source. I tried appealing to their business sense and should package the open source with a DSP tutorial - a new sales channel. Nope. Maybe I will try again and suggest I take the financial risk and mkt this as a seperate DSP hands-on tutorial similar to the old heathkits but integrated with a DSP course...

Not sure if disassembly is an option as many software packages have the legal "do not disassemble..." clause. Ideas??

Joe

or You can order a CD-ROM from www.funkamateur.de with all issues from
1..100. I haven't received it yet and can't say anything about the
quality of the scanned documents, though. But it looks like a good
idea.

Normally signatures should not be quoted, I know. But the following
sneeks up quite often and might become a major problem, if nobody
complains. Don't take it personal, but as food for thoughts for
everybody in that newsgroup.

> --
> Sam Daniel -- daniel@netcom.com --
> **
> Windows is like playing in a closet.
> Linux is like playing outdoors.

Hmm, I don't want to be impertinent, but why do You follow the bad
ideas of Windoze software, if You prefer a *real (TM)* OS?

1. Not a severe problem, but: Your signature is not separated
correctly. It should be "-- ", i.e. the space is missing. This is the
only correct signature delimiter and every newsreader should be able
to process it. Surprisingly my newsreader recognizes it as a
signature, although this is not correct.

2.
> <!doctype html public "-//w3c//dtd html 4.0 transitional//en">
Maybe I am too paranoid about that, but You just added 595 bytes of
completely redundant data. This means, adding the same information a
second time and adding completely useless gimmicks like colour or font
information to a Usenet posting is simply a waste of bandwidth.
Although Microsoft et al. want to redefine the world again and again,
this is not, what Usenet is made for. Apart from binary newsgroups,
discussion is done using plain ASCII (and this for good reason!). So
please switch this off. You won't make a lot of people happy with HTML

in Usenet.

3. Again, don't take it too personal, I have just seen this bad habit sneeking up more and more in the last weeks and thought it might be time to complain now.

3405. Re: cascode rf amp

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-13 00:00:00 UTC
From: Tom McDermott <Tom.Mcdermott@usa.alcatel.com>
Message-ID: <3804800A.E4290FC8@usa.alcatel.com>
Source record: 66433

The cascode amplifier was originally devised to help extend the frequency response of the input stage. The Miller-effect dramatically decreases the bandwidth of an amplifier due to multiplied gate-drain capacitance. (or grid-plate, or base-collector capacitance). By loading down the grounded source gain stage with a low-moderate impedance (the common-gate stage) the voltage swing on the input stage is reduced, and the Miller-effect
is significantly reduced. The output stage then transforms that impedance up to a higher value adding voltage gain. This can be done such that the DC supply current is shared in series between the two stages (to minimize power dissipation).

At 6 meters, the J310 has plenty of bandwidth when arranged in most amplifier topologies so that the Cascode circuit is providing no practical benefit due to bandwidth increase. Gate inductance can critically limit bandwidth in common-gate amplifiers. The U310 is the same die as the J310, but with a metal package, it's gate lead is bonded to the metal

can. This allows soldering the can directly to ground for common-gate configurations. It sounds like you have plenty of gain, so your circuit configuration must be OK.

The input stage must be designed and matched to the J310's lowest-noise input load reflection point, which is not the same as the maximum gain point. The J310 should have fairly low noise in the 6 meter band. It's necessary to design the input matching circuit for best noise figure, and the spec sheet for low-noise devices usually includes noise contours indicating the NF versus the operating parameters of the device. I am streching back 20 years here, so take the following with some haze and lack of accuracy, but I recall the U310 in the common gate configuration having lowest noise when the input was matched to 75 ohms, and I think it was less than 2 dB. In the gounded-source configuration this

will all be different, of course. You need to get the datasheet for the J310
to determine the best input matching configuration.

A quick-and-dirty way to test noise is to use a 50-ohm resistor at room temperature as a noise source. If connecting it causes the noise to increase,
then you are in the ballpark of 3 dB or better noise figure.

I think that most of the remote door devices are Infra-Red devices. At least I know the ones on the jeep grand cherokee are... Not as long range as radio, but it seems to work pretty good for what it is used for. You might want to look into getting an extra transmitter for a remote start kit, or a power door kit, and popping it open. It would cost a bit more, but you could probably produce en masse after you get the numbers off of the IC's..

Hmmm ... but there are cheapo chips that transmit digital data in the 900 mHz range, are there not? I hear of sprinkler control systems and pool monitors and suchlike that *interfere* with radio, so I assume they are transmitting.

Source record: 66361

I just heard on the HCJB Ham Radio program that a new home computer networking technology that operates 3-30 mHz has been approved and that manufacturers expect 75% market saturation within 3 years. It will obliterate the ENTIRE HF spectrum with noise!

Also the telephone companies plan to send the same system down the telephone lines so that they will be able to send video to subscribers.

Source record: 66362

Hi all

I got a copy of the digital scan converter for Meteosat images article (VHF communications 1/83) from a friend and it is exactly what I need. I know that a PC can do it through a sound card etc etc but I want a dedicated box that just sits on the shelf and receives. I was wondering though, has anyone seen anything more up to date? I see some shortcuts were taken (eg. lower resolution) due to memory prices etc etc but memory these days is a lot cheaper and have far more capacity.

While I am about it, does anyone know where I can get detailed HRPT info? I found some sites with decoder schematics using FPGA's, but I am the type of person who wants to know whats "inside" :)

Kind Regards

Ming makes some units that I've used. They're 300 MHz with a superregenerative receiver. They also include a digital encoding/decoding system. There's several form factors -a fixed receiver board, a fixed transmitter board and a key fob transmitter. The fixed boards have the capacity to have an external antenna, while the fob uses a PC trace. The fixed units have DIP switch programmable IDs, while the fob requires trace cutting to set its ID.

As to how well they work, the documentation claimed a reliable range of 10 ft for the fob/receiver combination. By putting a tuned, matched groundplane antenna (5 pieces of coat hanger wire) 10 feet up in my wooden garage, I was able to get the key fob unit to work reliably from 128 ft open air, 60 ft with the keys in the ignition. 3-element yagis on both the transmitter and receiver gave me a very reliable 1/4 mile (this was a remote light switch to turn off the neighbor's security light when I was using my telescope).

I bought mine from Marlin P. Jones (http://www.mpja.com). The downside is that the Ming units do not have FCC approval for commercial use.

3416. FET switches

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-14 00:00:00 UTC
From: Shawn Upton <supton@eece.maine.edu>
Message-ID: <3805DD73.41C6@eece.maine.edu>
Source record: 66366

I'm thinking of doing some homebrew in the future (or I wouldn't be writing here now would I?), maybe a bandswitched design, something to fool around with. Anyhow, could I use FET switches to switch RF signals? I think the CD4000 series of chips have a few chips where I could wire up a voltage controlled switch (like what they use for switched capacitor designs). Is this feasible, or is the RF signal through the FETS going to be badly attenuated/distorted?

I suppose I could model it in SPICE first, which leads to a second question, I suppose. I have RedHat 5.0 (or 5.2, I forget), which has some version of spice. It's not the same one as I use at school, which leads to problems--I can't get it to work at home, and there is no documentation! Anybody have an idea on how to get spice to read in a netlist? [Here at school I use spice -b <netlist.spc> > out.out to run sims; at home the computer does not recognize -b and just sits there.]

Thanks.

Try page 70 of the 1999 RadioShack.com (formerly TechAmerica) catalog.
They have UHF transmitter and receiver modules for under 10 bucks each.
Unfortunately, they operate at 433.92 MHz, which might make you
unpopular with 70 cm enthusiasts in your area.

Yes. There are published designs that do this, like the Norcal QRP
Club's 38 Special.

These switches are fast enough that they make nice mixers.
Both at AF (see S53MV's zero-IF designs, for example), and at
RF. I've built radios that use a 74HC4066 as a switching
mixer, and they work very nicely. The faster bus switches
(e.g. FST3125) work even better.

I haven't seen anyone mention the CK768.
In the 50's, as a Jr. High School geek, I built a 3 or 4 xistor
radio using the CK768 for the RF amp, a 1N34A for the detector,
and 2 or 3 CK722's for the AF amp. I built it in a plastic,
see-through, compartmented box -- and I still remember the
"GEE, WOW - but why would anybody want one?" reactions from
many of my peers...

The 4000 series is not fast enough. There are plenty of CMOS switches
around, however, which can switch RF signals. Have a look e.g. at
Maxim (www.maxim-ic.com). Another fine project is the Tayloe mixer,
which showed up some time ago. Dan Tayloe used a very fast bus switch
to build a quadrature down converter.
If You can live with lower frequencies, You might try the 74HC series.

Are we talking about the Weathercube from thirty years ago? If so, there was a modification for it in QST in 1971, April, May or June. It was part of an article about cheap methods for receiving 2M FM, more an idea article than real specifics.

A few years later, I bought a portable Weather radio from Radio Shack, intending to convert it to 2Meters. It was varactor tuned, and it was easy to get it onto 2Meters, though I can't remember whether I rewound the coil(s) or padded them down. It did not work very well.

The circuitry explained it. I assume the original Weathercube had a similar circuit. I think there was no RF amplifier, and the IF strip was at 10.7MHz and looking nearly identical to what was in an FM broadcast radio of the time. Perhaps the transfomrers were tuned up so it was somewhat narrrower, but there was no ceramic filter for good selectivity, and the limiter was feeble or non-existent.

Maybe Radio Shack had more recent, and better Weathercubes, and the above is irrelevant. I did pick up some hand held CB sets at a hamfest (for a dollar each, I should have bought them all)a few years ago, and they had built in reception of the Weather Service transmissions. But the Weather section wasn't much better than that old RS Weather radio. It was crystal controlled, but the IF was oddball because I sure couldn't figure out a combination of that crystal that would give a 10.7MHz IF. The IF strip was just IF transformers and discret transistors. It sure wasn't anything special.

I am left curious about the present-day Weather radios at Radio Shack. It would be nice to find that they are in fact double conversion receivers with ceramic filters at 10.7MHz and 455KHz, as seen in a lot of consumer equipment nowadays. That would make for a decent receiver, and would

require only a new crystal and some readjustment of the front end tuning circuits. But I'm not prepared to spend the money on such a radio just to see if it uses a good design.

It does seem unfortunate that this sort of thing is no longer commonly seen in the magazines and handbooks. Like a lot of things, it's easier to find information when a topic is new, and then later when it becomes common it gets covered in less detail.

Of course, single frequency FM receivers in the 2Meter range are relatively common. I was at a garage sale a few years ago, and the guy had boxes of old pagers for a dollar each. I assumed the were superregenerative, and bought only two. It was awful when I got home and opened them up to find what must be decent receivers with crystal filters in them. The real trick would have been figuring out how to bypass the tone decoding, and I couldn't be bothered with those.

The 49MHz superhet walkie talkies have a nice dual conversion IF strip in them complete with ceramic filters. I suppose one could muck with the front end to move it to 2Meters, but I think the easiest thing would be to bypass the front end, and build your own. Something of that complexity were common in the old days, in the form of 2M converters and even complete

They might need a little more extracting, but cordless telephones often have 10.7Mhz/455Khz double conversion IF strips of similar quality to the walkie talkies (and a lot of scanners I gather). Though don't spend a lot on it, since some are single conversion to 455KHz. The cordless phones, at least of recent vintage, actually have two of these IF strips, one in the handset and the other in the base.

Cellphones have nice IF strips, though I think they all have a first IF much higher than 10.7MHz.

And I imagine it's easy to find narrowband FM receivers of barious origins
at hamfests. Even at the puny (compared to Rochester) local hamfest I've
found such boards, and they go for practically nothing since few are
interested (though older 2Meter rigs carry a still hefty price, surprising
until you consider that they may better handle strong RF). One could either
track down data on them, or simply salvage the filters and identifiable
IF ICs, and build something using those parts.

If I understand his question correctly he is looking for a FET switch to switch RF to different circuit sections, not operating the switch at RF speed. I would think that the CD4066 series would work through HF for that application. When using the CD4066 you must use a split supply, i.e. +/- 7.5 volts, if the RF signal voltage goes negative relative to ground. The RF signal amplitude should be limited to not more than +/- 5 volts in this case.

Hello,

Check out http://hfradio.org - a site with many resources for Shortwave Radio and Utility Listeners, Ham Radio Hobbiests, and others who might be interested in this type of content.

So, come on by and check out my non-commercial SWLing/Ham Radio website. The URL is http://hfradio.org and features DX information, including QSL Route/Manager Lookups and Callbook Lookups; a Propagation Center including my eAlert service (allows you to sign up with your email address. Then the eAlert system will send you email propagation reports. I use this with my pager.); Equidistant Azimuth Map software (allows you to create maps of any QTH); Swap and Shop; Bookstore (I've hand-picked over a thousand book titles on radio, etc.); Free website space for YOU to create your own Ham or SWL site, and there's more. Easy to navigate. Open for suggestions.

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

73!

3433. Re: Tentec RX-320

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-15 00:00:00 UTC
From: Joe Jesson <jjesson@ais.net>
Message-ID: <eVDN3.1$yp4.47@news.ais.net>
Source record: 66237

I have been developing a add-on DSP last IF for any receiver which supports 10.7
and 455KHz IF. The driving idea is to offer a FFT-based spectrum display as a
DSP educational tool. I have taken a 15 KHz last IF from a WJ receiver and input
this signal into a sound card in order to see the modulation and bandlimited spectrum.

I have developed code to offer a 44.1 KHz sample (22 KHz displayed FFT) and hardware to mix and amplify the IF to a 15 KHz last so the SB card can handle.
What a fantastic tool! Especially when combined with a swept spectrum display to
see a broader spectrum window.

Zoom Mode:
<= 22 KHz modulation and signal strength window use an FFT run on standard PC

Spectrum Analyzer Mode
>22KHz use swept receiver model

Would anyone be interested in participating in a mailing list, new newsgroup,
or collaborative web site on the "DSP Receiver" topic? Think we could get enough votes to launch a comp.dsp.receiver newsgroup?

Thanks, Joe Jesson, KB9LZB

I was reading the original question as wanting to switch tuned circuits,
though signal path switching did occur to me.

I wouldn't use the 4000 series. The 4016 has a horribly high on resistance
(and the 4066 is somewhat better but other devices are far better). And both
the 4016 and 4066 are hard to use for analog purposes because you have to
run it off a dual supply (and oddball voltage to boot since it's
maximum supply voltage is low), and thw switching thus has to be of those same
voltages. I remember trying to use it that way for audio use twenty years
ago, and it was more trouble than it was worth.

I haven't looked recently, but I thought there were some in the 4000 series
that worked better with analog signals (they had some sort of level shifter

on the control pin?) and definitely the later devices had better specs.

But I think if I was using something for signal path switching, I'd look into other devices, particularly, as someone else pointed out, those from Maxim.

If the original question is about switching tuned circuits, I don't recall seeing CMOS switches being used that way. They aren't ideal switches, and in that sort of application you do want something really good.

Yeah, I was just looking for a way to switch signal paths in the
circuit, not a T/R switch but the same idea (lower power). I'll go look
at Maxim and/or Mini-ckts and see if they have what I'm looking for.
thanks.

I don't think that adding DTMF to the 1220 would be that hard, simply inject the tones from a tone board into the audio in line somewheres, but I've never done it, so don't bother listening to me.

As for the FX146, I've thought about buying that as the price is good, and building a little PIC processor to get continous tuning, but after a bit of thought, I wouldn't save any money on it. $100 for the radio, $30 for the case, $40 for the tone board, $30 or so for the mic, and I'm at the same price for buying a Icom/Yaseu/Kenwood low end 2m only mobile that has all that built in and 50W to boot. Just not worth the mods.

However, I might just buy the FX146 for one reason--if all I want to do is packet/APRS, this would do it. No need for the mic or tone board, so $130 for a 12 channel 5W radio is a deal.

I think you would have this problem with any FET type switch when you want
to handle bipolar signals. I have used the CD4016's at work but not for RF
applications.

There is one more thing to consider. If there is more than one switch per
package you need to watch how much signal isolation you have between the
switches. You will get some amount of cross talk between the switches if the
FETs are all on the same die.

A long time ago, I built a single channel, crystal
based, single conversion 27 MHz AM receiver w/
ceramic filter. Was cheap and worked pretty well.

Seems like there should be plans somewhere for
something similar in VHF. It would be a nice
project for somebody that just wanted to listen to
the local repeater.

Of course, picking up an old bearcat at a hamfest
could be cheaper & simpler, but what's the fun in
that?

FOR SALE HAMMOND 3 KV PLATE POWER TRANSFORMER.

Brand New. Still in the crate. Hammond No. 37478.
2900-0-2900 volt @ 750ma ICAS rating.

Weight approx. 100 lbs.

For sale USD $200. plus transport.

I have a quite recent Weather Rx from RS and it seemed like they used
a 10th (!) harmonic of a crystal with a 455kHz IF and the strip
appeared to be DC coupled.

Don't know what to do with the thing! :-(

> Cliff WA9YXG

With all due respect to HCJB if they made the same claims as you
have paraphrased they clearly have failed to check their facts. The
whole thing doesn't sound right technologically anyhow. You sure
they weren't talking about bandwidths varying from 3-30 MHz wide?

It is illegal for anyone to broadcast a signal that interferes with other
communications. Just imagine the class action lawsuit Hams will have
against any company that causes such illegal interference ... we could
fund all sorts of charitable Ham-related activities!

There are International treaties and US laws that would be breached
by any such interference ... and guess what, Ham signals are just as
likely to foul their systems ... unless they are very well shielded ...
thus protecting us from them as they protect themselves against us.

Let's not panic, let's get some facts. I am guessing they were talking
about bandwidth rather than bands. Once we know more we can discuss
a strategy to respond effectively, if at all. If we have a challenge before
us we need to remember that it is amazing how QRO on the air and
through the political process can get people's attention!

One thing you used to see in the ham magazines, but not much recently, were "cavities" made out of tin cans. Run a stiff piece of wire or tubing up the middle and tune it with a variable capacitor. Quite narrow considering the frequency range they were used, which was usually 2meters and up. I've wondered whether they'd give enough selectivity so you could drop 2M down to a low IF without an intermediate conversion. It wouldn't be a high performance receiver, but it might make for an interesting simple receiver where low cost or simplicity was desired.

Or the extension of that would be to use a whip antenna instead of the center conductor, so you have a selective antenna. An intersting path if you're interested in simplicity. I've seen articles about these, though I can't supply references or even what the antennas called.

A few months ago I participated in a thread on this group about the well

known tendency of the Scout to drift or jump up to a KHZ or more in extended CW transmissions. Someone was kind enough to email to me a mod (a simple R&R of a single capacitor, if I remember) that cures this problem.

Unfortunately, while upgrading my mail client, I lost the saved message.

Would the person who emailed me this information please get in touch, or

alternatively, if anyone else knows the correct procedure and part values, please let me know via email. Thank you very much.

Mike I don't know anything about the Flag antenna. But an electrostatic shield should go to a low potential point, one with no signal on it. That needs to be some sort of ground, almost anything will do. Try connecting it to the coaxial outer conductor if the SWR is low. If not, connect it to the radio ground or to a water pipe.

HAMFEST October 24, 1999 - Lindenhurst, LI

GREAT SOUTH BAY AMATEUR RADIO CLUB
ARRL APPROVED LONG ISLAND HAMFEST - October 24, 1999

LINDENHURST, LI - NY

On October 24, 1999 the Great South Bay Amateur Radio Club will again sponsor an indoor Hamfest-Computer Show. The location will be at the:

Knights of Columbus
400 South Broadway, Lindenhurst, NY.
This is an ARRL approved Hamfest.

There will be radio equipment, electronic components, computers and accessories, software, books, technical manuals, ARRL information, Amateur Radio License Exams, Door Prizes.

Advanced registration is $15.00 each table. Tables at the door are $20.00 each. Contact Peter Portanova WB2OQQ at 516 541-4886 for table reservations. NO TABLES WILL BE RESERVED WITHOUT PRIOR PAYMENT due to the space available.

General admission is $ 6.00.

VE - ARRL - 12:00 NOON at Babylon Town Hall, 200 E Sunrise Hwy, Lindenhurst. For exam candidates please remember to bring your original FCC Amateur Radio license (if licensed), any C.S.C.E. forms that are pending, plus a photocopy of each, pens, calculator, formal form of ID (preferably photo ID), and the examination fee, to the exam session. 1998 ARRL/VEC fee is $ 6.35, exact change is appreciated. Novice exams are free.
The VE team is from ISLIP ARES Group and GSBARC. Thanks guys.

Talk-in will be via GSBARC Repeaters on 146.685 4Z(136.5) PL.

Food Service during the Hamfest will be provided by members of the Knights of Columbus Council.

Information is also available during the GSBARC 2 meter info net every Monday evening at 7:00 PM following the Newsline Report on the W2GSB repeater, 146.685 -600 4Z(136.5) PL required. You may also write to:

Although "Rating Unknown Power Transformers", by H. Q. DuGuid, published
in "Electronics World" in July, 1964 (pp. 24-25), obviously doesn't
account for "recent" innovations in transformer design, maybe it will help.

Try the RX2 from the Remote Imaging Group - http://www.rig.org.uk. The
kit is ï¿½49.50 but you have to join RIG first, although you get a
quarterly magazine and other benefits explained on the Web pages. I've
just joined and bought a kit and must say the RX2 works very well, a big
improvement over my IC-746 which was too narrow for good WXSAT
reception. RIG have sold (IIRC) 800 or so kits and offer a free repair
service if you get in a mess!

3478. Re: Slug-tuned inductors?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-18 00:00:00 UTC
From: Reg Edwards <G4fgq.Regp@btinternet.com>
Message-ID: <7uftl9evl1@neptunium.btinternet.com>
Source record: 66278

For radio receiving purposes the most effective and practical method of "permeability tuning" is to close-wind enamel-insulated or Litz wire on a thin cardboard tube. A ferrite rod, 10mm diameter, 100mm long slides in and out of the cardboard tube. An inductance ratio of 10 to 1 is attainable. This gives a frequency range of approx 3 to 1.

Ganged tuning rods can be used. In a superhet receiver It is possible to use one ferrite rod for the RF coil and another ganged rod for the local oscillator coil, the position of one rod being displaced with respect to the other to give a the IF difference frequency.

It is possible to arrange for the the rods to be drawn in and out of the coils by a nylon-braided cord which is wrapped round a pully wheel operated from the receiver front panel. The tuning indicator is a pointer attached to the cord which moves in front of a scale calibrated, for example, from 510 KHz to 1600 KHz.

Fine RF/oscillator tracking is acheived by moving one rod inside its coil relative to the other rod inside ITS coil.

Before 1940 the tuning scale was calibrated from 200 metres to 580 metres and iron dust cores were used. This was a less expensive and lighter-in-weight arrangement than a two or three-gang 500pF variable capacitor but not quite so mechanically stable. It was prone to greater frequency drift versus temperature and knocks and bangs.

Permeability tuned receivers have the advantage of more constant sensitivity over a the frequency band.

3479. Extremely small transmitters for radiotracking?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-18 00:00:00 UTC
From: Martin Gorissen <Gorissen@t-online.de>
Message-ID: <380B87E7.4E98D76B@t-online.de>
Source record: 66279

Transmitters for radiotracking small animals are simple designed, but expensive. The component costs are about 10 per cent of their price. They usually consist of a multivibrator pulsing a two-stage crystal oscillator. Using SMD components, also SMD crystals, commercially available models reach a weight of 0.3 g (without battery).
Who has any experience, if this is within reach by do-it-yourself? A central problem would be the availability of single SMD crystals for the 150 MHz range.

Howdy you-all.

I have tried building an all american five that uses the following lineup for
HF
superhet-style variable tuning condenser (made for the medium waves)
12BE6 converter
12BA6 IF amp
12AV6 detector/agc

I used bank wound coil formulae for the RF and
Osc coils... got it working covering about 7000 kc to
13000 kc. Added a BFO too. Works great except
that I notice stations appear twice on the dial. I
thought this might be the osc and rf preselector
crossing each other but stations appear twice a
few kc away both at the top of the dial and at the
bottom. I would think I would see this phenomenon
happen only near the crossover point where you would
expect to hear the station at the -455 and +455 kc
sides of the preselector.
Any body have an idea what I am seeing? Tried using
a non-superhet style condenser i.e. the plates for the
osc section are not specially cut to compensate for the
crossover phenomenon at medium waves, but I see this
problem occur using this new condenser.

Thanks in advance, you radio pal tony

had some requests earlier for Weinheim Scripts, and this year I did
not obtain a copy so I had to investigate into this matter

information about the Weinheim (DF0UKW/DL0WH) VHF convention is found
on http://www.2burgen-apotheke.de

or
http://www.ukw-tagung.de

and the books may be ordered at the DARC-Verlag http://www.darc.de or
http://www.darc-verlag.de

but this does not include 1999 issue
so then you must send an email to
DARC-Verlag darcverlag@t-online.de

perhaps the DARC site will be updated later(?)

73 jan-martin LA8AK

PS. at least a few of the sites has information in English, so pse
don't hesitate to see what VHF/UHF/SHF technical discussions are going
on in Europe

> 13000 kc. Added a BFO too. Works great except
> that I notice stations appear twice on the dial.

If I understand you correctly, I believe what you are describing is
the image frequency, thus:

Say you wish to rx 10.000MHz... Preselector tuned to 10.000MHz
Osc tuned to 9.545MHz----> desired sig beats to IF of 455KHz

Now you wish to rx 10.910MHz... Preselector tuned to 10.910MHz
Osc tuned to 10.455MHz---> desired sig beats to IF of 455KHz
BUT!
The signal on 10.000MHz (which you are not interested in now) sneaks
through the single preselector tuned ckt at a reduced but still
substantial level, beats with the osc at 10.455MHz to make the same
455KHz IF as before. Ergo, there are *two* local oscillator frequencys
that will beat with any antenna frequency to produce the IF frequency.
Or, if you will, there are *two* antenna frequencys that will beat with
the local oscillator to produce the IF frequency. It is up to the
preselector's tank(s) to reduce the unwanted antenna frequency from
reaching the mixer.

At HF frequencys, a single tank just doesn't have sufficient Q to pick
out one and knock out the other. This is one of the disadvantages of a
superhet that haunted Armstrong the inventor of same. It lead to the
developement of double and triple conversion designs, where the first IF
was a relativly high frequency so the image signal would be sufficiently
far from the desired frequency so tanks with obtainable values of Q
could reduce it's level.

Hope this made sense. Add more tanks to your preselector, and you
should see this problem start to go away.

One place to get permability tuned coils complete with the mechanism
is old car radios. Many were permability tuned. While they weren't
linear, unlike the permability tuned oscillators in Collins equipment,
having the mechanical parts all worked out sure make the idea more
approachable.

The AM broadcast band cores will at least be fine for medium wave,
and hopefully work somewhat lower in frequency. If the inductance
range isn't right, one could rewind the coils. I've seen suggestions,
though I've never been sure if anyone had tried it successfully, to
change the cores so you can use the mechanism in other frequency ranges.

Over the years, I've also found just the permability tuned front ends
at surplus stores. You'd stil have to work up some sort of dial mechanism.
Years ago, I did use the coil as part of a medium wave variable oscillator.
It was stable, and the multi-turn was a nice advantage.

Well it turns out to be not so bad and not so simple...

Software/soundcard DSPs can clean up the audio. I really like and recommend the very elegant GNASP1, freeware from http://members.tripod.com/~gniephaus/gnasp1/gnasp1.html, by the way.

I'm perhaps not hearing meteors after all. Meteor heads decelerate quickly and so the audio "ping" drops in frequency. The things I hear don't do this.

Thanks to everyone for your thoughtful comments!

You don't have to have dual supplies to use 4066s to switch audio. You can
use a resistor divider to bias the switch to half rail and capacitively
couple the audio signal. There are still problems with horrible cross-over
like distortions which I have never worked out.

The "on" resistance varies from around 300 to about 1000 Ohm, depending on
the instantaneous signal voltage.
At least two ways exist to minimise the effect of this:
1. Ensure the load impedance is much greater (say more than 100 times) than
the switch differential resistance (of 1000 - 300 Ohm).
2. Keep the signal level low eg. use the switch at the "virtual earth"
point in a summing amplifier.

It's an idea that comes up every now and then in this
newsgroup...

In this month's Electronics World (U.K.) there is a fully
digital FM receiver. It connects the antenna (though some
filtering and amplification) to a high-speed ADC (Harris/
Intersil HI5766), processes the bit-stream further (HSP50016)
and then demodulates it in DSP (ADSP-2181). The buzzword
that makes it go is "sub-Nyquist sampling".

I thought it was rather cool...

QRP/Amateur Radio/Microcontrollers

Shawn

I have built a QRP SSB transceiver for 80/40/20 which used simple diodes to switch tuned circuits for each band. Basically there are two diodes at each end of the filter in a series/parallel setup to the signal path. Use inductors to ground/feed DC to the diodes. This setup gave >70 dB of isolation at HF. I used some SM diodes I had but I couldnt tell you what they were! I presume ordinary 1N4148 would work at HF. At Uhf/VHF you would have to use PIN diodes but these are quite expensive and difficult to get for HF. (apparently UHF diodes are not suitable). You could use FET switches but this seems rather complicated. The only problem was that the setup was a little lossy due to the forward resistance of the diodes I used. Another alternative is a NE630 DPDT 50 Ohm switch but these rather expensive.

Richard

List Of Stamp Applications (L.O.S.A for short)
==============================================

If you have done something (big or small) with the BASIC Stamp
that you are willing to tell others please use the form below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Then e-mail the form to:

cj@hth.com

With the following as the subject:

L.O.S.A Contribution

Or you could point your Web-browser to the following URL and fill in
the L.O.S.A form on the Web-page...

http://www.hth.com/losa.htm

The latest version of L.O.S.A is always available at the above
mentioned both in ASCII and in ZIP-file format for easy download.
An index of L.O.S.A is posted to the following mailing lists and
news groups, I will update it approx. once a month.

Mailing lists:

BASIC Stamp Mailing List

News groups:

comp.robotics.misc
comp.home.automation
sci.electronics
sci.electronics.misc
rec.radio.amateur.homebrew

FTP-site:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

You can also find the latest version on the following URL...

http://www.hth.com/losa.htm

3502. Help with Simple Transmitter/Reciever

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-19 00:00:00 UTC
From: Jim <jimchapman@entercomp.com>
Message-ID: <3rapXeBx5oJIt0MchMjB4pBQjgs0@4ax.com>
Source record: 66302

My goal is build a simple radio transmitter and reciever with a range of about 20 meter. It's only function is to start a sequence of events controlled by a computer, ie. reciever side trigger a 5Volt input. I have seen a few transmitters and reciever schematics out there but don't know which of them, if any would work together. Can some one please point me to a simple pair that are known to be compatible.

thanks
jim

I would use a garage door opener,they will work for 20 meters and more,they also have filtering to keep out unwanted sigs etc. w4pqw

The diode switching idea apears to be the better idea, at least better
than trying to figure out how to get the FET's to switch well. I think,
when I get around to doing some homebrew, I'll just use diode
switching. Thanks for all the responses!

The book _The Art of Electronics_ contains a detector circuit using a tunnel diode. They credit it to a radio astronomer at The Haystack Observatory. Don't have the page reference or ISBN number; the authors are Horowitz and Hill.

Source record: 66307

Thanks, bob!

I checked and found the same station
anywhere on the dial to be about 1 MHz
apart (455 + 455!) .... One is very much
stronger than the other.. At medum waves,
I dont have this problem as I am only tuning from about 200 to 500 metres. At
HF with
that kind of bandspread, I will try winding
coils for higher Q, or change the preselector scheme entirely. Another
person replied re: overcoupling of the IF.
I do wind my own IF coils too, but dont
have proper lab equipment to check for
bandwidth etc.. I am using 'kentucky windage' and I know the bandwith cannot
compete with commercial shielded coils but they are quite adequate and work
well although of a low Q as I am band winding them on an acrylic rod and cant
quite get the criss-crossing of the #30 AWG wire to lessen the effects of
distributed capacitance.
Thank you all for your replies, I hope some
of you who have tried this reply too, and
perhaps some of you who are curious will
try it too, it really is quite easy and you
dont need any special tools, although a
spectrum analyzer and sweep gen would be a nice addition to the 'scope.
:-)

Your radio pal, Tony

Howdy, Folks.

This is an open invitation to browse http://hfradio.org, the NW7US Ham Radio and Shortwave Radio Resource Website.

This non-commercial site offers:

+ Azimuth Map / Equidistant Map Creation (choose any QTH as center, many options

+ Propagational Resources (live, real-time reports, eAlert service (sign up for automatic email solar/geo reports, complete with Aurora index))

+ News, and DX information and reports

+ QSL Manager and Callsign Lookup center

+ Swap and Shop

+ FREE HOME PAGES THAT YOU CAN USE TO POST YOUR OWN HAM OR SWL SITE

+ Bookstore - SWL and Ham related books. Over a 1000 titles so far.

+ Plus more (Directories, etc.)

This is my offering to the community, all funded by me. I am working hard to bring excellent content to the site. I have need for others who might wish to assist. I need a Software editor -- someone who can review and post software links, etc. Let me know if you are interested. (See the site on how to email me).

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

73!

3509. A/D computer card?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-19 00:00:00 UTC
From: Roy Lewallen <w7el@teleport.com>
Message-ID: <380CBCCF.C8EA9CC5@teleport.com>
Source record: 66309

Does anyone know where I can get a card for a PC-type computer to do some simple data acquisition? I'm looking for a relatively inexpensive (say $100 or less) A/D converter plug-in card. It doesn't have to have particularly good resolution (8 bits would be adequate) or accuracy, and a fixed input voltage range is o.k. I used to get a catalog from a company making ruggedized computers and the like for manufacturing applications, and they had that sort of thing, but most of their products were understandably pretty expensive. Does anyone know of one more oriented toward the hobbyist?

I don't want to spend a lot of time fiddling with it, so a plug-in board is really what I'm looking for.

Roy Lewallen, W7EL

Source record: 66311

BSoft has a 12 bit card for around $79 - the ANA200 - it has an 8255 type PIA so there is a lot you can do with it. Their URL is www.bsof.com

It is extremely easy to run an 8 bit ADC or DAC off LPT1 - the book "Controlling the World with Your PC" includes a CD-ROM with the DLL's you need under Windows98.

Dear All,
Thank you for the info. When I realised that I didn't need the high temperature resistance of the original device I substituted a BC107 which appears to do the job very well.

The TS500 now appears to work and I am just building up the courage to re-align it.

regards and thanks

Robin

One of the hard parts of making a crowbar circuit is making it fast enough that the overvoltage won't kill your radio before the crowbar kicks in. Probably the most reliable and fastest is simply a herky zener across the output. (A problem with this is that its dissipation might get very high before the fuse blows.) One that's a little slower can be made like this:

Connect an SCR with the anode to the supply line and cathode to ground. Gate to ground through a moderate sized resistor. Zener from the gate to the supply bus (cathode to supply bus). I'd also put a resistor in series with the zener to keep from frying the gate. You can replace the zener with a resistor if you can tolerate the uncertainty of the SCR gate turn-on voltage to determine where the crowbar fires. The advantage to the SCR over the plain zener is that the voltage across the SCR will be low when it's on, so its dissipation won't be nearly as high as the plain zener. Also, it'll take out the fuse faster.

The care you have to take in the circuit design depends on the difference between the maximum normal operating voltage and the maximum allowable voltage for the crowbar to fire. If they're nearly the same voltage, you have to pay attention to things like gate and zener voltage change with temperature, zener voltage tolerance, and zener voltage as a function of zener current.

Make sure you have a fuse between the power supply and the crowbar circuit, and that the active device can handle the energy it gets before the fuse blows.

I hope they're not trying to pawn off "sub-Nyquist sampling" as a new idea. Tektronix sampling scopes dating back to the '60s use it. (Typical sampling rate for a 10-50 GHz bandwidth scope is 100 kHz to a few MHz.)

The Nyquist limit applies only if you require a real-time, frequency-unscaled replica of the input waveform. If the waveform is repetitive and you don't need the result in real time, you can sample much more slowly. (Of course, for real-time one-shot events you can also interlace multiple sub-Nyquist samplers to get what amounts to above-Nyquist sampling. Modern digital scopes also use this technique.)

James - Yes. Some years ago such an attachment was common. Normally it considered of something like a zener diode and a SCR. Connect your power supply to its load through a fuse and this device across the load. If the output voltage ever went high the zener would conduct and fire the SCR which would short the supply and blow the fuse.

What voltage where you look for as I may have some of these guys in the junk box.

Not really the same thing as equivalent-time sampling, I don't imagine.
What they're probably doing is recovering the intelligence from an alias
of the carrier, rather than the carrier itself. The baseband signal can
be recovered from a folded-over alias of the carrier just as well as it
can be recovered from the carrier itself. At first glance, broadcast FM
seems like a good application for this because the capture effect could
overcome interference from unwanted aliases.

Check out Lambda and Motorola Semiconductors. I am told they both have OVP modules. Be sure to get one with enough headroom so that it won't fire prematurely. Most radios can tolerate about 16 volts. Be sure your PS has some form of current limiting fuse before the OVP or things might cook. Another idea would be a zener/relay arrangment that pulls in if voltage gets too high or polarity reverses.

Hi Aart,

You might want to visit
http://www.monumental.com/rshorne/examples.html
which has an example wav file for "Meteor Trail Echoes" with that example
sounding (ping) much like what they identify as satellites.

This site also has a freeware spectrum analyzer, but the display format is more
that of the audiologist.

Source record: 66191

Greetings,

I'm thinking of purchasing a 2m transceiver kit. I've looked at the TenTec and the Ramsey FX146. Does anybody have any experience with either of these? Or alternately, can someone recommend a good kit? I'm on a tight budget.

Doug Moore KB9TMY (Formerly K6HWY)

While I've not built either of the kits in question, I did build the
Ramsey 440MHz unit and a TenTec HF QRP radio. I would recommend the
TenTec. Better quality parts, sturdier chassis/cabinet, better
instructions.

I'm currently building the Ten-Tec 20 meter to 6 meter transverter (and modifying it to use a 10 meter rig instead of a 20 meter rig, but that's another story). I think their kit is very good and their instructions excellent. Also, they provide good support via the phone. If ny experience is representative of all their stuff, then the 2M kit is likely a good choice. Ed

3529. Re: RF Choke value?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-20 00:00:00 UTC
From: Ed Schick <schick@#us.ibm.com>
Message-ID: <380e0594_3@news1.prserv.net>
Source record: 66194

I don't know how much isolation I'll need,
but this is not a precision instrument, so
I expect some "leak through" will do no
damage. I'll be using .01 uf after the choke.
And I'm wondering if I can get away with
a ferrite bead or two. The circuit is right
out of the ARRL amateur radio handbook,
but it does not discuss the choke at all, other
than showing it on the schematic. In fact,
there are two ciruits shown (in the 1988
handbook). I designed the thing on paper
first - then dumb me, I thought of looking
in the handbook. The first circuit I found
was identical to mine, except it showed
no choke. Instead, it spoke of using the
switching diodes in series AND in shunt
mode, to positively prevent the xtal that
is supposed to be off from running - a
concept I had not thought of. But no RFC
was shown, leading me to think I had
overdesigned. But I wondered about that
long enough to keep searching, and finally
discovered a schematic in there that did show
the choke. I was g;ad that my paper design
matched what I found - but stiil nothing on
determining the choke value. That made me
begin to think that the value isn't all that
important - just shoot for a large Z.
But, bottom line, I don't know enough, yet,
to figure it out. My hope is someone who
has played around with this will provide
some pointers - and yours - considering
how much isolation is needed - is good.
It opens up new line of thought: how do I
know how much isolation is needed? What
factors apply? How could I measure things
to determine that? And so forth - all stuff
I don't know. You whet my appetite!
Thanks, Ed

Depending on the circuit, a resistor may work as well as a choke, and is (usually) smaller. Otherwise, I'd suggest 10-20 microhenries ought to do it. If it's a Pierce oscillator, you may need the Q of the choke, otherwise an overtone crystal may decide to oscillate at it's fundamental and really confuse things.

3531. question about VFO design

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-20 00:00:00 UTC
From: Nick Caruso <nick.caruso@software.com>
Message-ID: <380E0FD1.3D23D4F@software.com>
Source record: 66196

A simple question (I hope):

I'm building a VFO. I've checked out lots of schematics/designs for homebrew VFOs, and they
all seem to have very restricted tuning ranges, often less than 1MHz.

Why is this? I can think of several possibilities:

1) larger tuning ranges lead to instability (for reasons I don't understand)
2) people are working with tuning caps that don't have reduction drives/and or have
small ranges of capacitance
3) just because they're designing for the CW portions of the various HF bands and don't ever intend to go outside them.

My guess is it's #2 or #3. Anything else?

My nefarious plan is to build an HF VFO that tunes from 7 to 8 MHz and mix that with a crystal oscillator running at 43MHz, yielding a sum at 50 - 51 MHz(*), and then use the thing with the miniR2 receiver and a T2 based SSB transmitter to do weak-signal work on six meters this spring/summer.

(*) Yes, I know I have to filter the difference frequency! Suggestions there would be welcomed.
my vague plan is to use a band-pass diplexer after the mixer, followed by some gain stages to
get me to 8 or 9 dBm, to drive the miniR2 and T2 mixer chains.

I've got a reduction-drive equipped 25-145pF air variable behemoth cap stamped "ARC" on one end, assumed to be of WWII vintage, so it seems like I should be able to get decent tuning over a 1 MHz range.

Is this reasonable?

thanks and 73

Ed,

Thanks for your input, and also thanks to Doug Smith.

I'm trying to get back on the air after a mere 39 year absence. Got my ticket back last year, and restored an old Hallicrafters 6m AM rig, but there doesn't seem to be any activity in my area - at least on AM. (Maybe there isn't any 6m AM activity ANYWHERE.) Anyway, while I'm putting together a 40M CW transmitter, I'd like to add a few more entries in my log.

Message-ID: <380e1a43.15222258@news>
Source record: 66198

Nick,

good set of goals. Go for it!

The reason for restricting the tuning range of a VFO that uses a
variable capacitor involves the mechanical limitations of such things:
It is tough to avoid drift and mechanical sensititivity when you have
a very wide swing of capacitance. For example, your 25-145 pF cap will
tune from 8 MHz down to 3.32 MHz with a 15.8 uH inductor. You will be
using only 20% of the range; not a problem in itself, but now any
backlash, vibration, or drift due to temperature will be five times
what you would encounter with a cap that was just the right size.

My suggestion is that you calculate the capacitance range you need and
pull plates off the cap until you can achieve just that. Or put a
capacitor in series with it to make the total change correct for the
tuning range you need.

Let us know how the projec turns out!

I have built the 220 MHz kit and if the 2m kit is similar then it is a "damn good kit".
I also believe that the ramseys kit has a inferiour recever and trasmitter. it is also hard to add a pl to it. where as the ten-tec kit is well designed and has a digital read out and pl out of the box. plus for $64 more you can have 30W out. this would also be a good radio to experment with beacuse you could custom program your own PIC microcontroller if you felt like doing it.

hope that helps,

> yrs. now.
>
Oh baby, does it ever.... ;) The input Z will vary over a
considerable range when moving through the classes. The input
resistance as well as reactance both change. Output Z is a tougher
nut... usually Z out is quite high and the output ckt is designed to
present a particular Z to the collector ckt for a given power out.
Motorola prints (or least did) a number of manuals that give specs for
many of their power devices. Most of the specs are for 50MHz and up
though.

Many of the DeMaw books do a good job of introducing this subject.

Good luck es 72

Wow, either the MRF 461 is VERY old or brand new. I could not find any info on it in my umpteen year old library. Anyway, yes, unfortunately, the S parameters will most certainly change when you change the class of operation. As a consequence, the input/output impedances change accordingly.

This is exactly what they're doing - and, no, they're not passing
it off as something new. But being able to do it on anything less
than a professional/military budget *is* a fairly new development.

I don't have a circuit diagram and beyond the fact that it looks like its in the psu but not HT I couldn't tell you. The diode looks like a 1N4000 series but fatter and is a diode not zener, a guy from the USA has emailed some specs, seems they know it there, but I can't match them up either. It's in a Matsui set that was sold here, a bit old now though.

It's me <RMAYER@kscable.com> wrote in message

I found the JVFAX software suite seemed able to do WEFAX; but not
via the sound card, you need a special interface (diagrams are included)
and it's not very hard to build. WEFAX is a multilevel grey-scale
tranmsmission mode, rather than the black and white of the simpler
two tone FSK used for `faxing' weather maps.

you need a wide BW at 137 MHz though Gary. Needs to be 80 KHz or so.

There is loads of PC software for downloading to do APT service, try
WXSAT as one good one.

Not sure about AMTOR but quite a few RTTY decoders available.

Well, how MUCH isolation do you require to satisfy "keep RF off the +12v"?
It's all a matter of what level CAN you tollerate? (-40 db?, -50, -120?
what?)
You will be using a bypass cap after the coil right?
What value is it? (It contrbutes to the isolation as part of a low pass
filter.)

==========
If you do not insist on 13.8 V - DC for your radio equipment ,you
could run your station with 12 V batteries.
ie deep cycle batteries as used for caravans/ mobile homes and solar
powered installations.
Depending on your operating habits and hence battery capacity ,the
batteries can be charged with a relatively low current 14.4 V power
supply with in series a diode and one or more car head lamp bulbs
(the latter in parallel)
This configuration will protect your equipment against over- voltage.
Moreover the overall cost might be lower compared with a high current PSU.
If you would make the car bulb visible from your operating position ,
if it glows bright and the radio is operating normally the power
supply unit (charger) has an over-voltage ,but the batteries will
keep the voltage to the equipment at a safe level . Only after a long
period the batteries could be overcharged.
If the car bulb is out of sight you can monitor its voltage
differential with a LED or piezo sounder / zener diode combination.
I am in the process of converting my 100 W HF station and low power
packet station to battery supply , with the ultimate aim of charging
the batteries (3 pcs 75 Ah ,costing equiv US$50.- each) by means of
solar- and wind power.
Why ? Just to learn more about the practical application of
renewable energy..... and being able to operate essential domestic
equipment for some time in case of a longer than usual power supply
interruption during the bird migration season or winter storms.

Hi fellow homebrewers.....Once upon a time I had a B&W catalog that had the 850A and 852 pi-network tapped inductance values for each band. I cannot seem to locate this old catalog any more, so I am unable to get that info, seems as though B&W does not show these items for sale anymore. Perhaps someone out there has an old catalog like I once had or may have this information. SO....if you know the 80-10 meter tapped inductance for the 850A and 852 either or both, can you send me the values...It would be much appreciated!!! Thank You........73 LOU

Interesting the built in AM -6 dB Bw is 6 kHz and -540 dB 20 kHz.
However I could go into the 8.83 MHz If at Q18 and build an external detector. The problem is I have no spec figures for the BW up to that point where the IF enters the predetection filter. The front end sections are in 2 MHz chunks so there is pososibly quite a broad band signal available at the input to the Predetection Filter.
Does any one have any measured values for the IF bandwidth up to the O/P of Q18 on the IF Unit (X48-3000-00) in the Kenwood R-5000 reciever please?

An impedance match in entirely unnecessary. Just plug the 500-ohm mike into the TS820 50K microphone socket and away you go. You may need to fully turn up the mike gain control on the 820. The audio quality will hardly be affected by a mismatch. It may even be more to you liking.

The lower a mike's internal impedance the lower will be its output voltage. If the output of your 500-ohm mike is insufficient to fully drive the TS820 an audio iron-core 10:1 voltage step-up ratio transformer could be used. But a 3 or 4 to 1 may do the job. Very often such a transformer is built into the mike case to provide a switchable dual impedance.

Or a single-stage, any npn transistor, amplifier could be used + gain cotrol + 3V dry battery. Try to avoid this inconvenience. Does the 820 mike socket have a pin which gives access to a DC supply ?

It may be cheaper and faster to purchase one of those inexpensive miniature tie-clip electrostatic microphones.

I've only built one TenTec radio, one of the QRP radios, and it was a
good kit. Couple of things I didn't like, nothing major, like I kept
breaking the solid strand wire they included in the kit (I had some junk
multistranded wire; problem solved). More importantly, there was no
reverse polarity protection on the battery, and guess how I figured that
out? Otherwise, excellent kit, with even better tech support.

Under Linux, there is definately a generic video driver, and you can
configure it for just about any combination.
As for sound card support, try getting a card other than a Soundblaster
working on Windows 95/98 without a
driver disk. This is down to hardware vendors to supply the linux drivers,
and I'm glad to say that they seem to
be catching on now.
Linux is not yet a viable desktop alternative, but is fast getting there. As
for how easy it is to configure Linux, try
configuring Windows NT (PROPERLY!!!) to be secure, and you'll find it can be
just as awkward as Linux. At
the end of the day, Linux is freely available, with the source, it is
distributed with a C compiler, and there is a
wealth of knowledge in all the many online discussion groups.
> Windows 95 or 98 there was no problem. (I cannot comment on NT,
> because it is not my practice to use multi-user operating systems in a
> single-user environment.)
NT is not solely a multi-user operating system, try getting dual processors
working under 95/98.

You didn't mention the speed or number of channels your looking for,
if these aren't too important how about using a PC sound card ?
Cheap ones will do 16 bits at 44 KHz. Or if slow is ok, but you want
more for your money how about one of the TI dsp eval kits. They are
serial interfaced, have two A/Ds and D/As plus a nifty dsp when you
don't need the A/Ds anymore. If this isn't enough...
Analog device has come out with a neat part called a "system on a chip"
or some such. Maxim has eval boards for their high speed A/Ds...
etc. Bobby K4BGA

Howdy, Folks.

This is an open invitation to browse http://hfradio.org, the NW7US Ham Radio and Shortwave Radio Resource Website.

This non-commercial site offers:

+ Azimuth Map / Equidistant Map Creation (choose any QTH as center, many options

+ Propagational Resources (live, real-time reports, eAlert service (sign up for automatic email solar/geo reports, complete with Aurora index))

+ News, and DX information and reports

+ QSL Manager and Callsign Lookup center

+ Swap and Shop

+ FREE HOME PAGES THAT YOU CAN USE TO POST YOUR OWN HAM OR SWL SITE

+ Bookstore - SWL and Ham related books. Over a 1000 titles so far.

+ Plus more (Directories, etc.)

This is my offering to the community, all funded by me. I am working hard to bring excellent content to the site. I have need for others who might wish to assist. I need a Software editor -- someone who can review and post software links, etc. Let me know if you are interested. (See the site on how to email me).

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

>Thanks to the group in advance,
>
> Mike N2JVT

It can be confusing. The sideband is NOT inverted if the local
oscillator is lower in frequency than the RF, and it IS inverted if
the local oscillator is higher in frequency. Think of a 10 MHz carrier
modulated with a 1 kHz tone, then turned into a USB signal by
filtering or something. The transmitted signal is now at 10.001 MHz.
Mix it with a 9 MHz local oscillator. The difference is 1.001 MHz. The
modulating tone still appears higher in frequency than the carrier.
Now mix it with an 11MHz signal. The difference is 0.999 MHz. The
modulation is lower in frequency than the carrier, hence lower side
band.

> Thanks to the group in advance,

If you take the sum frequency the sidebands stay put. If you
take the difference they're inverted. Consider the frequencies
at the edge of the passband and their analogues after mixing...

Depends if the L.O. is above or below the RF signal
being converted downband. Usually L.O.'s are below
the RF Signal when mixing down to the IF. The same
for Transverters. Thus no inversion of the SSB signal.

Interesting. I didn't have any trouble with the provided wire (though I
too prefer regular, stranded, hookup wire) but I did find it interesting
stuff; I've not seen wire like that before.

To be honest I didn't even think about the reverse-polarity situation!
One well-placed diode will fix that though, and it can be put in a place
(right on the RCA jack) where there's plenty of room for it.

Thanks for all the replies following my News Group message about "What 137MHz weather satellite receivers" are available for the beginner.

It seem quite clear that the RX-2 from the "Remote Imaging Group" is one of the best choices.

I have now joined the "Remote Imaging Group" and ordered the RX-2 Kit.

A total cost of ?52 for the kit plus a modest ?7 for membership for the remaining months in 1999 and a extra ?13 for the whole of the year 2000.

Thanks to all that sent replies either direct or via the new group.

Are you sure you need to design one? This sounds like a $10 part from
Mini-Circuits, unless you have unusual phase-noise requirements.

Hello,

This will sound a little arrogant, I apologize in advance, but:

How about a PLL with a DDS in the summing loop? This could be made on
two not very large PCBs (one: synth+uC, other: VCO). For the extra
design effort, you get:

1/ long term + short term stability
2/ no mechanical problems + compactness
3/ almost any reasonable tuning range, if you wish
4/ very fine tuning steps
5/ repeatibility (if needed ?)
6/ with good RF design practices, you get good performance (you still
need to build a clean VCO, etc...)

C'mon guys, mechanical tuning caps, free running oscillators..?
it's 1999...

3580. What is the current state of the art in HF fron end design?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-23 00:00:00 UTC
From: b_runner@hotmail.com
Message-ID: <38112f21.16300499@news.eisa.net.au>
Source record: 66144

Hi,

I am thinking about building an HF rig, so before I really start warming up the ARRL Radio designer[:-)], I would like to find out more about what can be done. Any hints, ideas, links, books etc, about this subject would be greatly appreciated.

I am very curious about the best currently achieved results in HF receiver front end design. For now,I would put aside the rest of the RX chain (I followed a lot of discussion about DSP/phase techniques here lately).

So for now I am looking at the best linear RF amps and mixers. For the amps, the best figures I have yet seen are for some push-pull amps : about 40-45dBm IP3. Have any of you gurus seen better figures+designs? I would imagine that it could be possible to get a pair of V-MOS FETs, run them in A-class (with large heat sinks), put a xformer feedback around and use two of those in push-pull mode... similar to transmitter amps, but for receive... Am I off track here? If this works, I would guess we could get over 50dBm IP3?

Now, with mixers, I am a bit on the fuzzy side here. I have seen the "Tayloe" mixer some time ago and it looks pretty impresive. Have any of you tried to replicate the results? I like diode ring mixers, or their variations, using other kinds of switching elements, eg. D-MOS FETs. These are linear, but have a fundamental disadvantage, the 5-7dB loss. So, when using them, if one wants to get sensitivity, a preamp is needed, and that reduces the linearity, which is counterproductive. Are there any active high performance mixers? With what I know now, if I was about to build a mixer, I woul do something similar as the amp suggested above: a couple of essentially super linear amps, but instead of DC supply, I would switch them on/off really hard. Perhaps a square wave between slightly negative bias (to switch the devices off quickly) and full A-class current?

Sorry for the long posting here... I seem to need feedback for my back-of the envelope thinking.

runner

A can oscilator works pretty good listen for a odd harmonic. If you
need more power build an amplifier tuned to the desired harmonic.

A NE 602 using an overtone crystal will work as well.

A new all-day DSP hands-on workshop is going to be held on November 8th in Schaumberg - a Chicago suburb. I decided to attend ($195) since the TI workshop gives each attendent the latest DSP starter kit to be used during the seminar. This board has the TI DMS320C6211 DSP chip - the 1200 MIP part! TI gives each attendent the board and covers the development software, C compiler and the GO DSP simulator and development software. This simulator is powerful and both scope and spectrum "probes" can be placed anywhere in th code. When all the FIR filters or any code looks good, you can download on to the development board. Much easier than looking at ASM code. TI's registration number is 1-800-750-3377.

Two types,

Diode detectors can measure peak level power. For measuring
average power, sensors usually have a thermistor in them to convert
heat into a calibrated DC voltage.

3593. Re: question about VFO design

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-23 00:00:00 UTC
From: Roy Lewallen <w7el@teleport.com>
Message-ID: <38120D79.9E87C036@teleport.com>
Source record: 66157

For some of us, it's a case of "appropriate technology". If I want a VFO for a single-band rig, I can design and build one in an hour or so with a dozen or so parts. The spectral cleanliness will be much greater than I can get with a casually-designed PLL, and the stability will be more than adequate. The current drain will also be suitably low for portable operation. Now, maybe you can throw together a couple of boards' worth of ICs, come up with great spectral purity on your first design simply as a result of your extensive experience, and have the whole thing running in an afternoon. And maybe you can even do it all with 5 mA of current drain and half the size of a pack of cigarettes. For me, it would probably require several weeks of work, not to mention getting the parts required, and I'd end up with something with heavier current drain and larger size than I want. (And I even consider myself to be a competent analog design engineer.) So it may be a logical way for you to go. But it isn't for me, and probably not for other folks, either.

Al,

He said "below -40 dBm." At that level, Schottky diodes are the usual method.

You have an interesting point there, Wes. -40 dBm is 100 nW, not
a whole lot of heating value at this power level.

I have (4) Eimac 4CX250F/G (8621) and (10) Amprex 8621 tubes for sale. I would like to get rid of these tubes because their just taking up space. Acquired them from estate sale for a project but not HAM qualified yet to start anything. Don't know the percentage of each tube but it was in a secret stash according to owners wife and never touched. Bought lot for $900 eight months ago. Will sell Eimac set for $200 and Amprex set for $400 or best offer. Any questions, feel free to email me and I'll send pictures. Thanx for looking.

3600. 10 Meter SSB/CW Transmitter plans needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-23 00:00:00 UTC
From: Lawrence Gruber <lawrence@javanet.com>
Message-ID: <38126100.59DC@javanet.com>
Source record: 66164

I'm in search for detailed plans for building a 10 meter
transmitter capable of SSB or CW modes with a power output
of, say, 2 to 20 watts. (I might also be interested in
20 meter CW operation)

I see that Far Radio supplies pcb's for two articles in
73's mag. The first is Feb '91 for a 10 meter 'SB' transmitter.
And the other is July '92 for a 10 meter DSB transmitter.

As I don't have access to these back issues of 73's mag.,
I can't evaluate these designs.

If anyone has suggestions and a construction article, I'd
be most willing to send you a few bucks in return for you
sending me a copy of the plans.

Oh, no license yet, but very soon. I'm also quite experienced
at electronic construction, including R.F. stuff.

You can contact me via. email at: lawrence@javanet.com

Regards,

Larry

Source record: 66167

The simplest (not the best) design would be a linear regulator.
All of the "brains" can be purchased on a single IC for a buck
or 2 at radio shack - an LM217 will do nicely. The LM317 can
handle only 1.5 amps, max, so you need some 2n3055
pass transistors and a big heatsink, plus some low ohms, high
wattage emitter equalizing resistors. And you need a hefty
transformer. You can make the emitter resistors from wire
and 2n3055s are cheap, depending on where you get them.
So your expense, if you have to buy all new stuff, will be in
the transformer, and, to a lesser degree, in the heatsink.
You will need to so some math to determine the number of
pass transistors and the length of wire of a particular size
to use to make the emitter resistors.

You could also build a switcher. Switchers are more efficient,
and harder to design than linears. You save money on the
cost of the transformer, which is the single most costly
part of a linear. Switchers run colder than linears - no big
heatsink is needed. They are smaller and weigh less. A
switcher is harder to "control" - ie, prevent damaging itself
and connected equipment if a component within the switcher
dies, and they are prone to produce a good deal of RF
noise. Personally, I believe the best approach is to learn
about switchers with small projects that are intended to power
devices that don't cost much to replace, if the switcher that
powers them fails and kills the device. At 30 amps, I believe
the device you are powering with the supply is too costly to
risk with a first time attempt at a home brew switcher.

3605. Re: question about VFO design

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-24 00:00:00 UTC
From: WIZ <WIZ@prodigy.net>
Message-ID: <01bf1dc9$6964a9e0$85f2fcd1@newmicronpc>
Source record: 66169

Nick,

I like the goal. Without commenting on the VFO
part of the design, why not switch 2 xtal oscillators
so you can cover all of 6 by selecting osc1 or osc2
to mix with the vfo? Or is the miniR2 no good for
whats above 51mhz? (I am not familiar with the
receiver.)

I'm doing that with a mod to the TEN-TEC 20meter
to 6 meter xverter: 2 xtals instead of 1 and reworking it for
a 10 meter instead of 20 meter if. I have a 10 meter all
mode rig, so I'll have full use of 6 meters when I'm done.

On to the VFO part: VFO's are hard to control beasts.
The smaller (physically, and therefore, electronically)
the variable capacitor, the less subject it is to variations
in spacing between the plates - therefore the more stable,
electronically. A physically big cap will have a much
greater tendency to vibrate when bumped than a small
one. Temperature gradients will be bigger over a wider
area than a smaller. And so forth. Thus, designing a
stable VFO for a small range with a smaller cap is
more "do-able" than going for a broader range with a
bigger cap. 73 Ed AF2P

3608. What is the current state of the art in HF fron end design?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-24 00:00:00 UTC
From: b_runner@hotmail.com
Message-ID: <3812b6a7.10686489@news.eisa.net.au>
Source record: 66172

Hi,

I am thinking about building an HF rig, so before I really start warming up the ARRL Radio designer[:-)], I would like to find out more about what can be done. Any hints, ideas, links, books etc, about this subject would be greatly appreciated.

I am very curious about the best currently achieved results in HF receiver front end design. For now,I would put aside the rest of the RX chain (I followed a lot of discussion about DSP/phase techniques here lately).

So for now I am looking at the best linear RF amps and mixers. For the amps, the best figures I have yet seen are for some push-pull amps : about 40-45dBm IP3. Have any of you gurus seen better figures+designs? I would imagine that it could be possible to get a pair of V-MOS FETs, run them in A-class (with large heat sinks), put a xformer feedback around and use two of those in push-pull mode... similar to transmitter amps, but for receive... Am I off track here? If this works, I would guess we could get over 50dBm IP3?

Now, with mixers, I am a bit on the fuzzy side here. I have seen the "Tayloe" mixer some time ago and it looks pretty impresive. Have any of you tried to replicate the results? I like diode ring mixers, or their variations, using other kinds of switching elements, eg. D-MOS FETs. These are linear, but have a fundamental disadvantage, the 5-7dB loss. So, when using them, if one wants to get sensitivity, a preamp is needed, and that reduces the linearity, which is counterproductive. Are there any active high performance mixers? With what I know now, if I was about to build a mixer, I woul do something similar as the amp suggested above: a couple of essentially super linear amps, but instead of DC supply, I would switch them on/off really hard. Perhaps a square wave between slightly negative bias (to switch the devices off quickly) and full A-class current?

Sorry for the long posting here... I seem to need feedback for my back-of the envelope thinking.

Which ever way you chose to control temperature for best results plot
the frequency as a function of set temperature.
You should have chosen or specified a crystal with a temperature
coefficientwhich changes from positive to negative at roughly the set
temperature then adjust the set temperature to exactly the turnover
temperature.
An AT cut crystal with a 70C turnover will be about 40ppm high (from
memory) at room temperature.
If you dont specify a turnover temperature it may be possible to use a
crystal with minimum frequency variation over -20+70 and look for the
turning temperature which will be at about 40C.

Have found it difficult to find much design info circuits on PWM.

Have put together Raab's class-E 700w pa for 160m and matched his best efficiency of 90%+ using a pair of IRFP450's.

Now it's time to modulate!

Anybody out there experimenting with or using AM solid state part or fully digital modulating techniques?

Tnx

Phil G4ZOW

I have found on a Japanese ham home page on using two crystals in parallel with about 22uH inseries and a variable capacitor 22 to 100pF..It does shift over +/_5khz and more on Freq.higher than 10mhz..Look in www.ac6v.comm in homebrew..73..VE7HCW..Wayne..sk..
Jim wrote in message <12267-38001473-129@storefull-115.iap.bryant.webtv.net>...
several years ago i built a crystal converter from a plan in radio electronics magazine. it was for listening to shortwave on an am car radio. now i have a newer car with a digital radio. it steps in even steps that are too large to get some sw stations tuned in well. i wonder if i could draw the various crystals off frequency with a variable cap in parallel with them. does anyone know about this? will a crystal pull off frequency enough to help this problem? how much capacitance is required? 50pf? 100pf? if this would work then i could use the variable cap like a fine tune control to get between the 10khz steps. on another angle, will two crystals oscillate together in the same circuit? could i use a 5khz crystal with the other ones to get the frequency offset that i need? will they work together or will i need another mixer circuit to combine them? (a pre-mixer mixer?) are there any other ways to skin this cat? any input is welcome

I have 2 IF cans, new in the box for the ARC 5 BC453. These are 85kc, part#12011. One is still sealed and never opened, the other is in its box and wrapper, but has been opened. Also for sale and to be included with these cans are 5 new IF cans Part# G115A/G116A, and 3 new IF cans (WW2 era part#s22195 and 22196)On these latter parts I dont know what the specs are or where they came from - so dont ask. Hi! I want $20.00 for the lot plus postage. Youve gotta take em all. (Cleaning up the basement, and getting ready for a move.)

Source record: 66185

I am selling 61 assorted sweep tubes (list below).

I recently purchased a garage full of parts from a retired TV & radio repairman. I'm an audio guy and I don't use sweep tubes, so I'd like to sell them off. I was told by the seller that some were new, some were used, but he wasn't sure which were which, and most weren't even in their original cartons (some were loose). I have checked all of these tubes on a B&K 667, and have verified that all of the tubes listed below test LIKE NEW, have no grid emission/gas/leakage, and have no shorts. I have also re-boxed the loose tubes. (I rejected any questionable tubes during testing). During my testing, I made some judgements regarding the physical appearance of the tubes. The "rating system" that I used below ranges from "NEW-VG-GOOD-USED". The tubes marked "USED" may have discolored glass or significantly burned getters, but they STILL test "like new".

MAKE ME AN OFFER, I'm a motivated seller!!! Offers to buy the entire lot will be considered first, but I MIGHT consider breaking this lot up.

(FYI, if these tubes were purchased as NOS from that tube-selling place in Arizona, the cost would be over $1600...not that I'm expecting to actually GET that much.)

Interested buyers, please respond by email.

Regards,
Tom Mitchell

I found the one article by Ulrich L. Rohde DJ2LR
from the November 1979 issue of HR page 34
and a sheet I made up with a working schematic/equations
using the 2N5109.

The other is a schematic of the design based on U.S. Patent
3,891,834; 1975. I'm assuming that this is printable for
general consumption since 17 years has passed.

I'll clean them up this week and put them on my web page.

From: Jim Weir <jim@rst-engr.com>
Message-ID: <cJUUOA6NUAZxqBLtDRTvbFEQlkuC@4ax.com>
Source record: 66047

I've been pretty thrashy about what I considered a shortcoming of the ARRL Radio Designer not working with my video board and system. I have roundly criticized ARRL for not having any interest in technical help, but "send it back" for a solution.

For whatever reason, my system totally crashed and I was forced to reinstall EVERYTHING from scratch including the operating system, the video drivers, and most of the applications software (the data was backed up and I really didn't lose anything valuable).

When I went to reinstall Designer, I find now that it works. Why it didn't work before, whether it will quit working in the future are conjecture. It works now, and I'd like to apologize to the ARRL for my fairly pointed and negative comments. I'm still not thrilled with tech support, but the system appears to be as advertised.

3630. Frontend for FM digital radio

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-25 00:00:00 UTC
From: Tomas Ahrne <dirac@takethisoutalgonet.se>
Message-ID: <172R3.11724$7G2.69077@news1.online.no>
Source record: 66048

Hi,

I am currently designing a software radio (sampling the RF signal directly and doing all down conversion and demodulation in DSP [Digital Signal Processor]) for the FM band.

The DSP part is no problem as I work with this in my everyday job, but RF design is another thing. In theory I know how to do it, but I don't have the experience that you get after some years of working in a field.

Can anybody give me a pointer how to design a really high-quality FM fromtend. It would be comprised of an antenna input, AGC, and a band-pass filter. The band-pass filter should, of couse, have pass-band points at 88 and 108 MHz. The stop-bands should be at about 103MHz and 113 MHz. Phase should be fairly smooth with no abrupt peaks (not phase linear, though). Up to 6 dB ripple could be OK, although about 2 dB would be better.

What stop-band attenuation would be needed?

I need practical help and pointers.

The input stage must be able to handle weak signals as well as very strong ones. S/N > 75 dB (is it pssible?).

I have looked at a 14th order inverse Tchebychev band-pass filter and I could possibly design that, but it is the whole integrated front end that I need help with. What components do you use and how do you use them to get the best performance.

Can you for instance buy ready made band-pass filters for this purpose?

I'd be greatful for any help in the area.

Best,

Tomas Ahrne

> Hello,
>
> This will sound a little arrogant, I apologize in advance, but:
>
> How about a PLL with a DDS in the summing loop?

I think this is a reasonable question: for myself, the answer is simplicity. I'm not an EE, I'm a software engineer. I've read a bunch, soldered a lot of kits together successfully, and am now making a foray into building my own equipment, with a tiny tiny bit of design (er, parameter variation, rather) thrown in.

> C'mon guys, mechanical tuning caps, free running oscillators..?
> it's 1999...

It might give you some insight to know that I own a Hammarlund HQ-180 receiver -- I like the feel of the tuning, and the way the dial lights cast interesting patterns on the walls, through the perforated steel shell of the receiver late at night. That is, there's a large element of irrationality involved here...

Thanks to everyone for all the advice -- I really appreciate it!

best regards

Looking for distributors who sell the Belden 8230 cable... It's commented at the Butternutt HF9V antenna manual.

Interesting. I just ordered a pair, we'll see what they look like. I'd like to look into getting an Ethernet link working at 2.4 GHz.

I recommend getting a copy of _Communications Receivers_ by Rohde, Whitaker, and Bucher (McGraw-Hill, ISBN 0-07-053608-2). It has in-depth discussions of techniques used in state-of-the-art receivers.

Hi, Peter,

Yes, you're right on the money. You'll find low-barrier Schottky diodes in the most sensitive power sensors commonly available. With lots of averaging and a little bit of patience, levels as low as -70 dBm can be measured.

Two other types of sensors, thermistor and thermocouple, are still around, but their sensitivity is much worse, say, above -30 or -20 or so. So why are they still around? Because thermocouples can handle *really* high power signals without frying, and thermistors are the most accurate (due to their good match).

One of the best publications that any RF engineer needs to have on his or her shelf is HP Application Note 64-1, Fundamentals of RF and Microwave Power Measurement, available for free download at http://www.tmo.hp.com/tmo/Notes/English/5965-6630E.html

Regards,

Al W6LX

B&W 850A and 852 Bandswitched Tank coils:

For any interested parties, I had occasion to check on the inductance values for the various tap positions on the B&W 850A and 852 tank coils from an old catalog. They are as follows

The 850A is 13.6-6.5-1.75-1.0-0.8 uH. Capacity to resonate each band 150-80-70-55-50 pf.

The 852 is 7-3.72-2.34-1.34-0.95 uH. Capacity to resonate each band 268-144-73-48.5-36 pf

Bands are 80-40-20-15-10

And if you do the math, they don't hold the same plate Z on each
band...Think
it was one of Bill Orr's books that speaks of moving taps. It's a good
exercise to figure it out....

>and 108 MHz. The stop-bands should be at about 103MHz and 113 MHz. Phase

Rather than a fixed band pass filter, what you should use is a tracking
band pass filter that tunes to the specific station. This will
greatly improve the strong signal performance.

A design which is known to work is to use air core inductors about 1/4
inch diameter magnetically coupled to each other (about 1 inch spacing)
and tuned with series varactor diodes. The details are not published
so you would have to work them out from basic filter theory. Read
old papers published in the 1940's in Proc. IRE; they tell all about
how to build these things (except the varactors, which were air
variables in those days).

Is this easy? No. But you wanted a "really high-quality" frontend.
This is it. Anything else will be *much* worse. Believe me, I
have built them all and tested them.

For an easy front end, just scavenge one of those little FM
tuner cans from any receiver and tap in before the mixer. Sometimes
you see the tuners for sale in surplus catalogs with docs.
The performance will be ... nothing to write home about.

Now, all we need is some program material worth tuning in!

From: Jim Pennell <spam@nospam.com>
Message-ID: <7v38m2tuo1@nntp8.atl.mindspring.net>
Source record: 66062

One other detail about Thermistors Vs diode detectors is that the thermistor detector is an RMS detector and a diode is a peak detector with a correction factor thrown in by the display device and may not be accurate, depending on modulation technique of the signal being measured.

Although, for low level signals, diodes work quite nicely. Still, this difference CAN sneak up on a user.

make sure that the resistance between ground and the rest of the circut is
equal.
They way that I do it for the proffesional sound equpment that i use is to
"lift" all the devices except for one from ground, thereby forcing them all
to ground at the same place and it keeps 60 cycle hum from showing up.
(60Hz hum sounds really annoying at on an 800W sound system)

3647. Yaesu 5100 Mod problem...

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-25 00:00:00 UTC
From: jmtsr@mindspring.com
Message-ID: <3815ae8f.106605312@news.mindspring.com>
Source record: 66189

I just did the extended receive mod on the Yaesu 5100. When I turned it on after the mod to set the limits it will only let me set the UHF limits, but not the VHF.. it gets through with the UHF, and that's it. The VHF side is very limited. I have double checked the Mod instructions with the jumpers, etc..

The mod said when the unit was turned back on, you would see:

300.000 & 20.000

I get :

300.000 & 144.000

I have also tried the D/MR, F/W, REV, while turning on the radio, but still get the same 300.00 & 144.000.
What could be wrong?.. It will only set the limits for the UHF... anyone else run into this problem?

Here's my Jumpered list:

R4001
R4003
R4004
R4051
R4061
R4062
R4064
R4068
R4070
R4072

R4072 was unsoldered and jumpered.
R4067 was unjumpered for Band Switching. I replaced this, but still get the same results.
The only thing that I did , that the instructions didn't mention was I removed the head from the two ribbons connecting the control head.... didn't know if by removing one of the jumpers it reset the radio in some way, and that could be one reason, since the ribbons were not plugged in at the time of the Mod?

Thanks for any help.

Send mail to jmtsr@(REMOVEFORSPAM)mindspring.com

re: wanted... Heathkit SB-200 parts (HV board and whatever)

Hello there,

I'm trying to repair a Heathkit SB-200 amplifier, struck by the golden screwdriver (previous owners). If you have a spare HV pc board (not a charcoal brickette) from a repair or Harbach upgrade, I'd like to buy your old board. As long as it's in most any reasonable shape (no holes larger than a pencil eraser...)

Please contact me at the address below my name if you can help.

thanks

Source record: 65993

What you are seeing is the image response from your mixer. When you mix a local oscillator signal into one port of a mixer, and an RF signal into another port, the resulting output is two identical sidebands; one at the LO signal + the RF signal, and the other at the LO signal - the RF signal. The preselector in the front end of your receiver selects the desired sideband, either one can be selected; the unwanted sideband is the image. The image will removed 2 time the IF from the desired frequency. It would take a great deal of RF selectivity to remove this image response, with an IF of 455 KHz, for this reason, modern receivers generally use an upconverting design. As an example, if a high IF of 45MHz is used, your image response will be 90MHz away. Another way of looking at this is that the desired band of frequencies might be 0 to 30MHz, while the image band would be at 90 to 120MHz. A good low-pass filter that cuts off at 33MHz would put the image band far enough "down the filter slope" that these undesired signals would not be detected.

What's that supposed to mean?

J-M's advice was good and correct. The BC109C is an old 300 MHz Ft npn high gain (beta 400 -800) TO18 device very common in european designs around 20 years ago. It was even second sourced in the US by Motorola.

> conversion CW receiver for use with a QRP transmitter.

The receiver section of the "Forty-9er" transceiver might meet your needs. I used the trick of two crystals in parallel to get a tuning range of about 7 kHz, so that the rig could cover the 7040 QRP frequency and also hear W1AW. I also added an emitter follower between the NE602 mixer and the RFC2/C10 combination. The low impedance output of the follower boosts the sensitivity, and produces a peak in the audio response which can be set to your preferred beat note by selecting the proper value for C10.

Plans for the unmodified Forty-9er are available at

The tracking front end filter will have a bandwidth of 1 MHz or so.
Across any 200 kHz channel, it should essentially have flat group
delay.

>But you see, my problem is that I theoretically know how to design such a
>front end, but I don't have any experience in RF design. One thing is making

I'm still confused here. You don't want a tunable preselector, but
just a front end roofing filter. A simple 7 pole bandpass designed
right out of Zverev's Handbook with off the shelf components should be
fine for this purpose. (Use .01 dB Chebyshev).

>I am sure that an experienced RF designer knows how to make the gain stages
>to get the best S/N and lowest distorsion, where in the chain to put an AGC,

As an experienced RF designer, I am trying to tell you that an all
DSP receiver with no analog preselection is going to be very poor
at strong signal handling, even if you use a +27 dBm LO mixer.
Put an RF amplifier in front of your mixer and apply AGC to it.
Then at least on strong signals the mixer won't overload so bad.

3655. HELP! Making dial glass

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-26 00:00:00 UTC
From: Eugene Rippen <soundval@foothill.net>
Message-ID: <7v5pmk$r8h$1@ns2.foothill.net>
Source record: 65999

I need to make a replacement dial glass.
The old one is broken into 3 pieces, but I have all
the pieces. It is for a Silvertone communications receiver.

The markings are white and on the inside of the glass.
My thought is to make a transfer/decal, using a
copy machine?
Problem, how do I produce a transfer/decal with only
the white markings with a CLEAR background
rather than a black background? (and with the adhesive on the front side)

I realize that I could change the backing plate from black to white, and
make a transfer/decal of black markings.
But, I really don't want to change things that much.

,
Rick,

Thanks for your answer.

I am sure you are right that normally you should have a tracking band pass filter, but the idea behind a DSP based rdaio is that you digitize the whole spectrum at once and do the rest of the filtering and down conversion in software. In this way you can control all parameters in software. This also means that any filter will have exactly linear phase which is impossible with analogue designs. The only filter that is not linear, then, would be the analogue band pass filter, but you can quite easily measure the gain and phase of it and correct it in software to become linear as well.

But you see, my problem is that I theoretically know how to design such a front end, but I don't have any experience in RF design. One thing is making a design on paper, but then the real world comes in and throws you a curve.

I know this very well from my own field. Had this been audio or video, I could have done it.

After a while you collect knowledge about what circuits work the best (although in theory they all should be the same when caculated with ideal components).

I am sure that an experienced RF designer knows how to make the gain stages to get the best S/N and lowest distorsion, where in the chain to put an AGC, the best way to make an AGC, if it is better to use RF transistors instead of ICs, what kind of inductors to use in the filter etc. etc.

This is what I need help with.

Best,

Tomas

That seems to happen quite a bit these days. I support some software
for the company I work. Have seen more times than I can count a
complete reformat and reinstall of the Windows 95 / 98 OS clears what
appears to be the third party trouble. Most will go kicking and
screaming into a complete reinstall of their OS. I know it can be a
big job. I had one who owned an IBM Thinkpad, the software would not
see the serial port. He did a complete reinstall and the trouble
magically cleared. Glad it worked for you

Hi,

What's the best wire for making RF coils.
a) enameled copper wire ,
b) tinned copper wire or
c) silver wire.
the best as told is silver wire but more expensive then the other two.
Thanks.

Sotiris Antoniou .

3667. Build Radio Astronomy Stuff

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-26 00:00:00 UTC
From: joseph.buch@dol.net
Message-ID: <3815b313.7749423@news.dol.net>
Source record: 66076

I have a copy of the Proceedings of The IRE (Institute of radio Engineers) from January 1958. This is a special issue devoted entirely to Radio Astronomy. It contains over 350 pages of technical articles reflecting the state of the radio astronomy art in 1958. There are an additional 142 pages of advertisements for such exotic things as germanium transistors which also make interesting reading.

This monster issue contains papers by such world famous radio astronomers as C. M. Jansky, Grote Reber, and John Kraus.

There are articles about early lunar RADAR experiments with speculations on the character of the lunar surface deduced from the smearing of the echos; HF radioastronomy of Jupiter; construction of interferometers and polarimeters; sky maps and radiation brightness measurements of various radio sources; using lunar thermal noise to estimate the temperature of the moon; and using radio stars to study irregular ionospheric refraction and scintillation effects..

The January 1958 issue of the IRE Proceedings is not only an important historical reference, it is a short course on the science and engineering principles which amateur radio astronomers will still find useful today.

I have no idea what this tome is worth. I would like to see it go to some young person who will learn from it, preserve it, and pass it on to the next generation when the time comes to fold your antennas. Make me an offer by e-mail and describe your intended use for the document. I will consider both the price and your intended application in deciding who gets it. If no offers are received, it will go to ebay.

Actually, none of the above. The best is Litz wire, which is made up of a whole bunch of very small strands woven or braided such that in a given length, each wire occupies each position at least once. What this does is help overcome the "skin effect," which happens at high frequencies. For some reason, at high frequencies, the magnetic field repels electrons from the center of the wire, so most of the current flow is at the surface of the wire.

Failing that, enamel-coated copper wire. Tinned copper wire is uninsulated, so you'd get one big short, and I've never heard of silver wire, unless you mean the stuff jewelers use, which is also uninsulated.

If you have an open-air coil with some space between the windings, then silver-plated copper would be the best, because of the skin effect, above, but you'd probably have to do something to it to keep it from tarnishing.

Cheers!
Rich

"It depends." If you're working in the 10kHz to perhaps 2MHz range, Litz wire is good. See this url for selection of appropriate wire: http://www.neewcweb.com/litz/litz.htm -- look at the "technical info" and from there the "list of charts" I think it is. Beyond that, it depends on just what you're trying to do. Generally the highest Q coils above 2MHz or so will be air-core with as little low-loss supporting insulation as possible, with turns spaced about two wire diameters, center to center, and for a given coil volume, length about equal to diameter works best. For those coils, silver plated wire can work well, but there's some evidence that not all silver plating really improves the wire's RF resistance. In any event, the maximum improvement between pure polished copper and pure polished silver will be about three percent, the square root of the ratio of DC resistivities, probably not worth the effort of getting the silver. You're probably best to use polished bare copper wire which is given a light coating of low loss varnish (to keep it from corroding): a very thin coating of clear acrylic spray should be OK, even though acrylic is not particularly low loss. It's easier, and about as good, to use enamelled wire. Tinned wire is nice if you have to tap the coil, but it's not the lowest loss solution. You can make large coils with soft copper tubing since the RF current is practically all in the outer 0.1mm or so. You can also wind coils on forms, such as powdered iron toroids, and make coils much smaller and with lower external field than air-core, and with similar Q--though not generally as high a Q if size is no object. Enamel coated copper wire should be best for those, since insulation is important.

Cheers,
Tom

3673. how SET clock on this radio?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-26 00:00:00 UTC
From: mcalhoun@ksu.edu
Message-ID: <7v4n4l$mtn@unix1.cc.ksu.edu>
Source record: 66082
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Here's hoping someone will know how to set the clock on an old Sears
"AUTO REVERSE AM/FM STEREO 6 + 18 MEMORY" (written on cassette flap)
car radio (Model 643.509510) which I recently bought at a junk store.
It's so old that Sears Parts 800-number can't find anything about it.

The radio has a very heavy-duty feel and is removeable (by pulling on a
handle) from a plug-in "chassis". In addition to the three power (+12V,
GROUND, and CLOCK) and four (LEFT and RIGHT/FRONT and REAR) speaker wires
(all nicely labeled, so it was trivial to hook-up) and the antenna input,
there are two tiny coaxes (labeled LEFT and RIGHT) with RCA jacks.

FIRST QUESTION: are these liable to be
INPUTS (from some unspecified external device)
or OUTPUTS (to an amplifier, perhaps?)

The radio retains all memory-bank frequencies and the clock time when
it is removed from its "chassis".

On the front panel, in addition to the tape cassette hole (covered by
the flap mentioned above) and three buttons (EJECT and two labeled
PROG--probably direction? I haven't tried a tape yet) for the tape
player, it has:

CD - (input jack) - presumably (I haven't tried it yet)
an "auxiliary input"
ON/VOL - (rotary) - obvious use
FAD - (rotary) - "fades" sound from front to rear speakers
TONE - (slide) - obvious use
BALANCE - (slide) - "fades" sound from left to right speakers
All the rest are pushbutton switches:
BND - selects AM or FM or, in memory mode,
selects between AM to FM1, FM2, FM3 memory banks
M/S - selects between Mono and Stereo
RCL - Recall CLock?? replaces frequency with clocktime in display
for about 5 seconds or, if clocktime is showing, returns to
frequency display
ME - MEmory - used for storing dial frequency in one of six memories
1 thru 6 - memory-recall buttons
^ and v - changes dial frequency up or down
AS - Automatic Scan - scans entire frequency range starting with dial
frequency and stores six stations in memory (selection criteria
unknown--maybe the next strongest six?), and returns to the
original dial frequency.
PS - Programmed memory Scan - scans through current memory bank,
pausing about 5 seconds on each channel

first six

SECOND QUESTION: How do I SET the clock????

Suggestions will be appreciated.

If you're winding very high Q coils, the tin on tinned wire might lower
the Q noticeably. Otherwise, none is noticeably better than the others.

In the interim you can use octal sockets.

Hi gang,
Anyone know of a good source for BC109C transistors? I know I can get
a sub via ECG/NTE but I'm looking for a better (cheaper) source.

Tnx es 72 Bob

BC109C is a very old transistor, designed in early 60's, would be
better to use a more modern version like BC239C or BC549C or a
replacement

> Working around 500khz.

Mike,
I have recently been playing with the AD8307 log detector. They are ***impressive*** little devices. (Easy to get going & stable providing you use double sided PC board with one side used as a ground plane). The AD8307 data sheet has a circuit using an AD603 variable gain amplifier ahead of the AD8307 to achieve a 120db dynamic range. I haven't tried this.

From my experience with the AD8307 on its own, you are going to have to be ***VERY*** careful with layout & shielding. The AD8307 can easiily see leakage through the shield of cheap coax cable. You may need to consider double shielding of everything to get your 100db+ of dynamic range.

I wonder if anyone can tell me how to increase the audio out an the above pmr Radio's. I obviously have located and turned up the deveation but the audio is very low. I guess there must be a surface mount to change but I do not have the circuit or a clue. If anyone knows how to increase the tx on either the vhf/uhf (basically the same) radios I would be most gratefull.

I have a yaesu FT-707 with no final amp board in it. (the low level driver, driver and final are gone.) I get about 7 to 10 mw at what used to be the input to the PA board. THe output filter board is intact, so I have PA output filtering available.

Has anyone seen a good circuit, (or even an available board) for a broad band amp, suitable for cw and ssb (no class C stuff) in this input power range, 3.5 to at leat 14 mhz, capable of 10 to 20 Watts output?

Back in the old days we would use tube sockets to plug our crystals
into. The octal tube socket can accomodate two FT-243 crystals and
are probably more available than the two-pin ceramic sockets.

A single 6L6 should work fine. Or use a 12BY7 into a pair of 6146s.

I've done a bit of looking around in the past on this idea (but I don't
have a cb to convert--that is what holds me back from doing it myself).
Try looking around on cb mod pages; simply web search and a little bit
of digging will find a bunch mods for both radios.

Bob OM,
Look in any of the Doug Demaw W1FB books. There are lots of ways to
get 20W out, using inexpensive power mosfets in the final, and class A,
2N5109, 2N3966, etc drivers. For CW, Class C is the way to go of
course.
You could also build a vacuum-tube amp and driver, such as the classic
12BY7 driving a pair of 6146's. That would give you 100 watts out. SWR
proof, wide-range matching ability, lots of power gain.

73 and GL,
Don, W6JL

AFAIK, only over a limited range of frequencies, typically mid-kHz to very low MHz. See http://www.neewcweb.com/litz/litz.htm for more info.

Cheers,
Tom

3697. Available : Parts for Yaesu FT-2700RH ,2m/70cms FM transceiver

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-27 00:00:00 UTC
From: Frank Dinger <frank.dinger@zetnet.co.uk>
Message-ID: <19991027120820704 32@zetnet.co.uk>
Source record: 66013

To those homebrewers/repairers who require parts for Yaesu FT-2700RH
2m/70cms FM transceiver

The Sutherland & District Amateur Radio Club (SADARC) located near
Golspie in the north of Scotland , has been donated a faulty
FT-2700RH transceiver to repair other equipment using some of its components.

The 2 RF Power modules and casing have now been used ,but all others
components are still available ,perhaps to others who no longer can
get components/sub assemblies to repair their defective unit.

These components are now available for the cost of postage plus a
donation to SADARC.

Some items :
+Loudspeaker 8Ohms - 2Watts flange size 80 x 80 mm

++Front panel with display circuitry complete with knobs (complete
sub-assembly)

+++Tx board

++++RX board

+++++Lithium back-up battery on control board (micro processor is defective)

Apart from the loudspeaker , no components can be garanteed OK ,
although the risk of being defective is low.
The unit had to be scrapped only because the defective microprocessor
is no longer available.

For enquiries you can contact :

Secretary SADARC
Inver by Tain , Ross-shire IV20 1RX - Scotland UK

e-mail : gm0csz.kn6wh@ukrs.org

3698. 4D32 specs needed

Got several of 'em cheap - more than I'll use for my 32V2 - so I want to build an AM Tx with a couple of them in parallel.

Anybody got the spec sheet for a 4D32?

Thanks

Source record: 66015

I don't know about the Cobra 148 but on my Cobra 142 all that was necessary was to change a crystal and peak the RF stages in the receiver and transmitter. Makes a slick unit on 10 meters. Mine was modified and used as a 1200 baud packet node during the last solar cycle. Initially had a 75 watt amplifier on it, but could tell no perceptible difference between it and barefoot operation so discontinued using the amp. A nice feature of the Cobra 142 is it's solid state switching and even with very heavy packet use the rig held up without any problems.

73 de Jack

Who has info abt BC-109C command set, or did it exist at all? BC-221
is the lowest number mentioned in (Surplus Conversion Manual Vol 1
(1948) and Vol 2 (1948)

I'm looking to acquire one of the 70's era S-100 bus computer systems like the Northstar Horizon or Ithaca InterSystems DPA-1. If you have an S-100 based unit like that please contact me and see what we can work out. Purchase only, I don't have a trade. Also would be interested in an S-100 based modem if you have one. You can contact me a chipsndips@snet.net.

Thanks

3706. ATV Balloon question?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-27 00:00:00 UTC
From: Paul Breed <Paul@rasdoc.com>
Message-ID: <3817AC82.3A0260D@rasdoc.com>
Source record: 66022

How much power is necessary to get a useable ATV signal from a balloon
at 60K ft?

What sort of receiver setup do the ATV ballooners use?

How much gain, what kind of preamp etc.....

What kind of antenna polarization?

Do the ATV balloons usually use 70cm, or some other band?

Are the lowpower <1W 2M CW transmissions easily heard at altitude?

Paul (KL7JG)

Hi Paul,
I have lifted a camera and transmitter with a large balloon to about 120 feet via a fixed location kevlar string. (tied it to my Jeep's bumper). I was xmitting on 426mhz. Power was about 200mw. The antenna used to transmit was a wire extended out horz. Because a balloon moves with the wind this created phasing. The solution was a "Wagon wheel" antenna. It provides no gain but pics up a pattern from the sky and removes any phasing problems. With a preamp to make up for coax loss, I got about 200 yards range.

3714. High current JFETS

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-28 00:00:00 UTC
From: mnewman@clear.net.nz
Message-ID: <3817caa3.4523143@news.clear.net.nz>
Source record: 66030

Whatever happened to those high current JFETS that were around in the early 80's and used in high dynamic range rf applications?

ie CP640, CP650 etc by Teledyne Crystalonics.
P 8001, P 8002 by TI (in Germany I think)

They were used in common gate mode, specified as low-noise (approx 2 dB @ 50 Mhz), usable to 300 Mhz, matched to 50 ohm with VSWR < 1.5:1, with Idss up to 1 amp or so, and a high dynamic range.

What are the best alternative devices marketed today?
Are there any similar devices produced today?

3716. Need plans for 10 meter SSB/CW QRP'ish transmitter

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-28 00:00:00 UTC
From: Lawrence Gruber <lawrence@javanet.com>
Message-ID: <38180BEC.47CA@javanet.com>
Source record: 66032

I'm in search for detailed plans for building a 10 meter
transmitter capable of SSB and CW modes with a power output
of, say, 2 to 20 watts. A VFO would be preferable.

I see that Far Circuits (http://www.cl.ais.net/farcir)
supplies pcb's for two articles in 73's mag. The first
is Feb '91 for a 10 meter 'SB' transmitter. And the
other is July '92 for a 10 meter DSB transmitter.

As I don't have access to these back issues of 73's mag.,
I can't evaluate these designs.

If anyone has suggestions and a construction article, I'd
be most willing to send you a few bucks in return for you
sending me a copy of the plans.

Oh, no license yet, but very soon. I'm also quite experienced
at electronic construction, including R.F. stuff.

I will be using a Drake R8B for the receiver.

You can contact me via. email at: lawrence@javanet.com

It has been done in the UK many times, though the rules have now changed. It was a good way of getting rid of illegal, in UK law, SSB CB radios. You need to change some crystals to give you the new band. You need to re-tune the VCO and you need to replace the PROM so channels are ordered sensibly. There were kits and articles in magazines about 10-15 years ago.

You can order back issues and copies of articles directly from 73. I've done this a few times myself. Also, for better quality copies, check your local libraries. Even if they don't have the issues you need, they can many times get the issues or copies on interlibrary loan. And don't forget university and college libraries, including community and junior colleges. They usually have superb interlibrary loan services, and often extend "townie" privileges to non-student residents of their communities. You'd be amazed what you can get on the hardcopy web.

3722. HF PA; FET (IRF 640), Valve or ??

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-28 00:00:00 UTC
From: "Nigel L. Rotherham" <nigel.r@netline.co.za>
Message-ID: <38185FED.427E307F@netline.co.za>
Source record: 66038

Hi everyone :-)

I need to up the output of my ICOM 740 when running a portable station for scouts (JOTA) etc. and cannot use a better aerial system so hence the title, HF PA FET....

I have done a little research and see that quite a few enthusiasts are building FET based PA's without too many problems. Cost is an important factor and having located what 'could' be a suitable device at an affordable price I would appreciate ANY feedback from subscribers to this list regarding their own experience in building / operating a solid state HF PA.

I reckon a 250 W ~ 500 W design will be quite acceptable and as the devices I can obtain are only rated at 120 W I will have to parallel up a few! (2x2 or 3x3). The device I have in mind is the IRF 640. Has anyone used this FET? What should I expect re highest usable frequency? From the data sheets it seems as tho power FETS have a very high input capacitance :-(

Any alternative suggestions (bi-polar, valve or ???) or idea's are MOST welcome. If preferred, replies can be direct to nigel.rsa@netline.co.za BUT PLEASE REMOVE THE ANT-SPAM 'SA' FROM MY NAME! i.e. nigel.r is the correct name... <big grin>!

Many thanks in advance from sunny South Africa. Till the next time, KEEP SMILING :-)

Dear All,
I have just acquired a TS500. This is a nice, but rather old (abt 30 years) HF transceiver and it works very nicely.

Only problem is that it is a little unselective on CW, I guess that it must have a 1kHz or similar bandwidth.

Has anyone, back in the dim and distant past, built a 300Hz or similar CW filter for this or similar sets?. I am interested in adding one as a switchable mod.

Bob OM,

I would just use any older ARRL handbook's tube pages. They are
similar to a pair of 6146's in one envelope, are they not? That should
be all you need to design an amplifier using them.

73 and GL,
Don, W6JL

Yes, you are right, and I as I said earlier I could make such a design, but
since I don't have enough experience in RF design it would probably not be
good enough. I am looking at using an AD with SFDR (Spurious Free Dynamic
Range) of 100 dB. I don't think you just throw together some RF components
and get a front end that can match this performance.

> As an experienced RF designer, I am trying to tell you that an all
> DSP receiver with no analog preselection is going to be very poor
> at strong signal handling, even if you use a +27 dBm LO mixer.
> Put an RF amplifier in front of your mixer and apply AGC to it.
> Then at least on strong signals the mixer won't overload so bad.

Can you show me such a design, what components to use etc?

I am not sure that an all DSP receiver will be that bad. I won't use it for
DX-ing, just for getting high-quality FM where the transmitter of interest
is rather close.

The AD in question that I am looking at using has an S/N of 75 dB.Not very
much, ... but in the digital down conversion process you get what is called
processing gain. I will use a sampling rate of 56 MHz and down convert it to
about 200 kHz. The gain you get is 10*log10(56MHz/200 kHz)=24.5 dB.Now you
have an S/N of 99.5 dB. Not so bad.

You can probably gain even more by using a tracking band-pass filter to
track the FM signal and gain another 15-20 dB. A total of 115-120 dB.

Now, if you have several very strong signals you have a problem since you have to have enough headroom in the AD converter to allow for them to superimpose without clipping the AD. If there are 20 strong signals in the area (let's say they are of equal strength) you must scale down the input by 1/20 which is -26 dB.

With band-pass filter tracking you could get 90-100 dB S/N, and without it 74 dB.

Would you consider this to be enough?

The figures I am talking about are before demodulation. Maybe I should not use the term S/N, but C/N?

How much does demodulation improve this?

Any help on all the above would be appreciated.

But if I could get any more specific help on the RF stage, I would appreciate that a lot. Schematics, links etc.

Best,

Tomas Ahrne

3728. Re: HELP! Making dial glass

Haven't done this, so I don't know if it will really work...but here goes:

There are ALPS printers that transfer from a film ribbon. You can get all sorts of different colors, including metallic, and I'm sure white. Print with this onto a piece of transparency material, and cut out the material to match the (newly-cut) glass. Attach to the back of the glass.

There's a possibility that you could actually transfer the printing to the glass...

Another hope would be to find some 3M INT ("Image-n-Transfer") material, which is photosensitive and makes a dry-transfer, and use that to transfer directly to the glass. I believe it was available in white...but AFAIK, it hasn't been made in some time.

Of course, you could screen-print the glass, or have it screen printed...just what level of effort do you want to go to to restore the thing?

Cheers,
Tom

Sorry, I didn't see the original...hope this reply gets through...

I've recently done some work making a VCXO for a phase locked loop, and had to make the range wide enough to accomodate all possible manufacturing errors...so anyway, I've recently thought about and experimented with how to pull crystals. Adding more capacitance in parallel really isn't the way to go. You rapidly reach a point of dimishing returns. Realize that by adding more capacitance, you're pulling _toward_ the crystal inherent series resonance frequency. You want to go instead to _less_ capacitance. And there's a trick to that: you really want to go to greater capacitive reactance, and that gets a lot easier to do if you parallel the variable capacitor (say 5pF to 40pF) with an inductance to resonate it at the crystal frequency at the low-capacitance end (really a bit more inductance than that, cuz you don't really want to go to infinite reactance...). In the limit, the oscillation frequency goes to "infinity." Of course, you pay a price. The more the oscillation frequency depends on the external circuit, the less the crystal is in control and the less stable the whole thing is. But if you use enough inductance to get to an "effective minimum capacitance" of, say, 1pF, that should give you plenty of range on a 10MHz crystal. For example, I got 5kHz range on a 13MHz rock with an effective load ranging from about 20pF down to 5pF. Hope all this makes sense and is useful... (It's also happened to be remarkably linear freq versus varicap control voltage, over a 3kHz range or so: would make a very nice true FM modulator!)

Cheers,
Tom

At very low levels, it's probably not quite fair to say the diode is a "peak detector." The response is linear output _voltage_ versus sinewave input _power_, at low levels and when lightly loaded. I'm sure that's described in gory detail in the HP/Agilent ap note. It's a good thing to beware of, though...especially on signals that are narrow pulses with low duty cycle.

Cheers,
Tom

I have a little field strength meter I built for sniffing fox transmitters. It uses an HP/Agilent (our new name...time to start getting used to it. ;-) zero-bias detector diode...biggest problem is that it's rated at 1 (ONE) volt peak reverse voltage! But I can "see" signals as low as 30 microvolts, which is a bit less than -70dBm, with it. It has a logarithmic meter readout, so I can hunt from that level to close to a volt, then take off the antenna...

Actually getting to that level reasonably reliably took some thinking. The diode output is amplified by a MOSFET-input chopper-stabilized op amp. Important to have both low input bias current and low offset voltage.

Cheers,
Tom

3732. Scope arcs...

Not that I really need any sympathy, but just thought I'd share an interesting (or is that "distressing"?) thing that happened to me recently... I turned on my 'scope (some off-brand that shall remain nameless...;-) which I had gotten well-used a year or so ago to make some simple measurements a couple weeks ago. But instead of seeing the pretty blue trace pop up on the screen, instead, I _heard_ pops, inside. Hmmm. Oh, well, perhaps it just got moist and dusty. I'll take it apart and clean things up... But upon doing that, I discovered that the arcs were actually INSIDE the CRT. And I was hearing them. Hmmm...methinks there's a bit too much pressure inside that CRT. No cracks that have become visible to me yet; it hadn't been jarred AFAIK. I'm sure it's way too expensive a tube to bother replacing, though perhaps someone repairs scope tubes...or perhaps there's a good mate for this scope that's lame in some other way, and as a pair they could go happily through their golden years together. (If "1743" makes any half-dead scope you have around perk up its anodes, let me know and maybe we can play matchmaker.)

Cheers,
Tom

BF246 is a TO92 version, have seen it mentioned in the Dutch magazine "Electron" to file off one side and use thermal compound with this device for better cooling, the device you are looking for may probably be BF246C - having the highest forward conductance

for mixer termination J310 will work, provided you follow G4DGU's advice (Mutek) to use only 18 ohm source resistor (for 20mmho)
I've used some BF246C; with -6V gate voltage the current drain is 20mA, believe the forward conductance is then close to 20mmho

Believe Motorola made it but I never found it in their manuals, while BF245 was there

well,
in my experience it was the worst transceiver I ever owned, the audio
was very bad, but a very simple modification cured this, in fact it
consisted of a resistor (and capacitor) in the AGC. The quality was
just unbelievable, better than many other receivers I had, except my
own Drake 2-B

I made some simple filters using 77mH toroids, see ARRL handbook, they
used 88mH while I used European standard coil for similiar purpose

Another possibility...someone just posted an ad in
sci.electronics.design saying they do custom decals...I visited the web
site and it seems like they could make what you want in the form of a
clear overlay for the back of the glass. I think they might do it for
under $20, if I understand the web site right. May be worth checking
out: http://www.mich.com/~bjlavoie/decals.html

The standard way of doing this is to put the inductor in *series* with
the capacitor, not parallel. And the crystal is in series with the LC.
Be sure to use an L with high enough SRF. For extreme pulling, it
must be a high Q inductor too. Like a #67 toroid.

Where you might want to use a parallel inductor is directly across
the crystal to neutralize the holder capacitance.

You can do quite a bit better than 5 kHz at 13 MHz. More like 10 or
20 kHz. I once pulled a 20 MHz crystal over a 100 kHz range.
You are ultimately limited on the low end by inductor Q and on the
high end by the spurious anharmonic resonances a few 1/10's of
a percent above series resonance

I saw a request on info on the cable used for connecting power sensors to the HP 431 and 432 series of power meters.

I saved info on the connectors that I received as e-mail several years ago that may help in homebrewing your own. HP may still have the cable available since they had the 432 meter in their catalog last year. I'm sure that it will not fit into many homebrewers budgets though.

The posting from 1995:

You can buy laser-printable transparency film. (3M CG5000, I found it at Office Depot) It's designed for making transparencies for overhead projectors. You print on it just like paper, but you get the black marks on the clear plastic sheets. Since the B&W photocopy process is essentially the same thing, I would think these would work fine in a copier too. Though if you scanned the broken glass into a computer, you could use a paint program to edit out the cracks and make a neater transparency.

3746. Toner Transfer-2 sided board

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-29 00:00:00 UTC
From: af389@lafn.ORG
Message-ID: <3819B30E.1988AF57@lafn.org>
Source record: 66112

Hi,
I need some recommendations from you who have made a
2 sided pcboard with TONER TRANSER scheme, either with LASER or INKJET
printer. I have made single-sided pcboards with this scheme.

I am using PnP TONER TRANSFER FILM to create a small pcboard
that will be two sided. I plan to etch the board in two steps.

Place image on side one and insulate side two copper, then
etch the board. Next, coated unteched copper, apply coating to
etched side for 2nd etch protection,
heat board to apply 2nd side image to unetched copper.
Etch, drill, finsih board.

My question concerns
"what coating to use for insulating the bare copper."

Depending upon when I apply coating, I could be heating the
coated board while transfering toner. Will plastic coatings melt?
Do you do TONER TRANSFER before applying coating?

"What products are you folks using for "COATING"?
Varathane....liquid plastic from spray can?
Krylon...from spray can?
OTHER?????

What solvents do you use to remove the "COATING"
so copper can be made CLEAN enough to ACCPET 2nd
TONER TRANSFER image.

Some folks have used GLOSSY PHOTO paper for INKJETS by EPSON.
Can you folks also comment on what coating you use?
Do you avoid heating plastic coating? If yes, HOW?
Thanks for any help.

3747. Systron Donner Spectrum Analyzer

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-29 00:00:00 UTC
From: km5n.nospam@earthlink.net
Message-ID: <MPG.12839e744206d4dd989684@news.earthlink.net>
Source record: 66113
Cross-posted to: sci.electronics.equipment,sci.electronics.misc,misc.industry.electronics.marketplace,rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors

I recently fell into a great deal (I think...). Picked up a
Systron Donner SA for $25. It powers up, and responds to input, but
something is awry and I don't know enough about SAs to figure out if it's
me or the scope.
Anyway, I desperately need an Operator / Service manual for it,
and they are not available from the usual manual sources. The components
are:

712-1 Display
809-1 RF unit .01 - 12 GHz

and I *think* the overall combination is referred to as a 762-2A, or
something close.

Does anyone have the manual(s) that they can let go? Or any
advice on the unit, even if you don't have the manuals. Any and all
assistance is always welcome.

Thanks!

>milliamps/hour.
> Is there a semi-conductor that would make the constuction simple
>enough; I am not a electronic parts technician. (Too bad they do not teach
>us school teachers that as well.)

What is the radio, and what are its power requirements?

The battery pack spec just tells you that it puts out 9.6 V (but the
radio may operate OK on considerably higher and lower voltages as well),
and that its capacity is 600 mAh (that's milliamps *times* hours, not
milliamps divided by hours). You also need to know what maximum current
the radio draws when transmitting.

Then, what kind of "alternative" did you have in mind? You can use
a solar panel to recharge a NiCd pack, as long as the solar panel
provides enough current to recharge the NiCds in a reasonable time,
and you aren't using the radio continuously. To see if this is
feasible, you need to know how much current is put out by a solar
panel of a size that you are willing to carry, and how often you'd
want to use the radio.

If you aren't going to be hiking for really long periods, it may be
more practical to just take along an AA battery pack for your radio,
and enough AA alkaline cells for the amount of operating you expect
to do. Use lithium AAs if weight is very important and cost is not.

Message-ID: <38195ee1.56694771@news.online.no>
Source record: 66115

it reminds me of an experiment where I connected the xtal across a
tuned circuit in a Hartley oscillator. Used a 7022kHz HC6/U xtal from
JAN, and tuning capacitance was 100pF, don't remember all details.
When the xtal 'locked' it could be tuned over at least 20kHz range,
perhaps larger, but became more unstable on the sides, so it was
somewhat difficult to control the locking with the somewhat too simple
circuit. Have thought of building a more controllable circuit using
smaller tuning capacitor value and adjusting it to operate within
lock-range only

Greetings 137 MHz enthusiasts..

I've been looking for a newsgroup for weather satellite related discussions and have yet to locate one. So, I'll pose a few of my questions here which are probably easily answered by the folks that have been doing APT reception for some time.

1. What antenna has actually provided good clean imaging?
I've been looking at the various offerings here in the states regarding turnstile antennas and have wondering if they all perform nearly the same? A few of them such as the Vanguard APT-2 (http://www.multi-fax.com/apt_2.htm) actually has the preamp built into the antenna - bad idea? Others include Hamtronics & Woodhouse APT-2CP at the Hamtronics site below (about 75% down the page). Finally the "Swagurtenna" at (http://www.swagur.com/) - tag APT Antennas (left column) and scroll the right page. Any comments on these offerings sure welcome.

2. What receiver (or kit) is recommended here in the states?
Have looked at everything from Hamtronics' R139 (http://www.hamtronics.com/r139.html) to modifying a new $79 Radio Shack synthesized scanner. Comments?

3. What preamp (if any) is recommended at 137 MHz? Kit?
I've noticed that these have also been made available through kits such as Down East Microwave or, again through Hamtronics etc.

I've been nosing around a bit looking for additional information through the various Web sites and news groups. One very nice offering I've noticed is Swagur Enterprises / Time-Step's Web site (http://www.time-step.com/apt/apt.htm) locating their PROscan receiver. At this web site scrolling down about 75% of the page lets one see the inside and outside of a rather nice design. It should be at $399 in the states through Swagur Enterprises. However, it appears that the Hamtronics offering is about half that cost while inexpensive consumer scanners are less than $90 new in the states now.

Appreciate insight regarding APT trials and tribulations.

Cheers,
Gary

Tom mentioned another configuration operating into paralell resonnance
xtals while you are talking about series resonnance, but you did not
tell us which sort of xtals give best results. Older overtone xtals
are often better than modern xtals made specifically to have very
narrow tuning range

> Is this reasonable?
> XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX

The 'range' of your variable capacitor is from 25 to 145 pf? That is a ratio of 1 to 5 (roughly) Since frequency is proportional to the sqr.root of L and C. in a tuned circuit you should be able to get a frequency range of a little over 1 to 2. In theory you could go from, say, 6 to 12 megahertz.
frequency =1 divided by (2 times pi multiplied by the sqr.rt of L times C).
In a broadcast AM band receiver for example the oscillator tracks (approximately) from about one megahertz (455 khz + 560 khz = 1000 khz) to a little over two megahertz (1700 khz + 455 = 2155 khz); a ratio of somewhat over two to one. So, in a broadcast receiver the oscillator tuning capacitor must track from a low capacitance of, say, 120 pf to a high of say 500 pf.A ratio of about 1 to 4..
The range of 7 to 8 mhz is a much lower ratio So even with much other capacitance etc. in the frequency determining circuit the frequency range should be achievable.
It's almost 50 years since I did the theory on this but I think that's correct?
Good luck with your project.

Bob: Sorry no.
But when I went looking in my old, old, tube book, to see if I had anything I did find an RCA spec sheet for 4-125A/4D21. dated 1946.
SO, if anybody wants the specs on a 4D21? Please email me.
Good luck.
Terry S.
BTW I also found spec sheet for Western Electric D-86326 vacumn tube. ("similar to the 101D") circa. the 1920s! The D-86326 heater required one amp at 4.5 volts; four and a half watts; for one tube! I had donated that tube to a Telephone Pioneers display, complete with its original box, about 10 years ago.

believe I have a Kenwood VFO covering 8.2-9.2MHz for TR-7010 and other
2m transceivers anno 1975, perhaps you find a similar secondhand VFO
for very low price, should be quite easy to retune

Please forgive my interuption, but I would challenge the use of the word 'good'!

Ihe 'Clause aa' regulation was a shot in the dark with a scatter-gun, and killed off most of the amateur interest in cheap 10m activity and self-training in radio vis-a-vis synthesizers, VCOs etc. I don't think it made any real difference to illegal activity (and probably made things worse on frequencies other than the 'traditional' illegal CB hunting ground).

Sorry - couldn't resist a little bitch. Carry on!

Ian.

3762. Re: pulling a crystal off frequency

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-30 00:00:00 UTC
From: Ian Jackson <ianjackson@g3ohx.demon.co.uk>
Message-ID: <QoLUXQAWRrG4Ew4P@g3ohx.demon.co.uk>
Source record: 66128

It was once pointed out to me that crystals do NOT really oscillate in a parallel mode. A crystal can be represented by a series-tuned circuit with a big L and a small C (say, C1). Across this, in parallel, is a much greater C2 (predominantly the metallization on the surfaces of the crystal). For example, in a 50MHz, 3rd overtone crystal, C1 is about 0.1pF and C2 is about 5pF. Because C1 is so small, any additional external capacitor (by itself, as a frequency puller) has hardly any effect.

When the frequency is determined by the throughput of CURRENT, it is determined by the series resonance of L and C1. When the frequency is determined by the VOLTAGE across the crystal, it is determined by the resonance of L, C1 and C2 IN SERIES. This, of course, slightly HF of the resonance of L and C1. You can easily determine the characteristics of a crystal by feeding a signal from a generator (50 ohm) through the crystal into a 50 ohm RF voltmeter (with suitable sweep equipment, you can get a frequency vs amplitude plot).

As a result of the above, the frequency-amplitude plot shows the familiar 'blow-suck' shape ('blow' = max amp, 'suck' = min). Because the suck lies very close on the HF side of the blow, the frequency of the maximum throughput tends to get pushed LF of the frequency where it would be if C2 did not exist. You can stop this by tuning-out (neutralizing) C2 by parallel inductor. When you have the value of the inductor correct, there is only ONE resonance, ie that of L and C1, and the (series-resonant) oscillator moves HF.

I found that you can shift the frequency quite a bit by adjusting the parallel inductor, but probably not sufficient to make it a good VFO. However, I feel that the neutralizing of C2 probably gives the most stable and flexible pulling characteristics when you add a series-tuned pulling circuit to the crystal.

Am I correct?

Ian.

Hi Gents,

I need a circuit or method of connecting my TNC to the AUX connector of my IC-746 HF rig, and at the same time allow me to connect my mic to the front, without incurring signal loss. A friend tells me that there was a Hints and Kinks article in QST in the first 6 months of 1999 that talked about that very thing. Does anyone happen to know what month that article was published?

Thanks!

Please respond to W5HQ@NOSPAMhome.com - minus the "NOSPAM"

>lock-range only
There are various techniques for increased crystal pulling
Flat plate crystals will pull best
So 20 mhs fundementals are good.
below 10Mhz crystals are contoured and pull less.
Spurious responses are a real problem and will cause jumps in pulling.
Crystals pull below series resonance and have less spurious here.
Tuning out the crystal self capacitance help pulling above series
resonance. Dont use overtone crystals if you want maximum fractional
change.
For compromise pulling ceramic resonators will pull much more crystals
but will be more stable than LC.

You might do an Internet search on "mods Icom". I use
www.searchspaniel.com and select AltaVista, Excite and
DejaNews to search all at the same time. The others tend to
duplicate or always come up empty.

The same issue came up with the IC-735 and I *used* to know
the solution from several years ago when I had one ... but you know
how that is ... use it or lose it, I've forgotten the simple fix!

Also, you might E-mail IcomAmerica. I received wonderful tech
support from them via E-mail in the past.

Message-ID: <ObPS3.3386$n51.121470@news.inreach.com>
Source record: 66136

For sale: Merrimac PD-40-10

This is a power divider with 4 outputs...allows up to 4 receivers to share one antenna.

I don't have manufacturer's specs, but with all 4 outputs terminated with 50 ohm loads, the input showed flat SWR from below 2 mHz to just over 21 mHz. The load became slightly reactive above 21 but should be useable through the full HF range. Oddly, the SWR is flat again around 70 - 72 mHz.

Have 2 available now and may be able to get more soon.

Price is $10. Unit is small (approx 2"X3") and should be relatively cheap to ship.

Thanks

I received a spam copy. (this is the first one I've received from this source) The spam complaint has already been filed, including copies to amazon.com and crbbooks.com. I would presume Amazon, being basically an Internet business, is not interested in selling books written by people who have no consideration for Netiquette.

Good luck with the suit. This is the only way we're going to stop these crooks.

(and since it apparently has not been obvious to everyone reading... the fact that I post in ham radio related newsgroups does NOT constitute permission to email me ads!)

Tom,
I had the same experience years ago with my first Heath SB610 monitorscope. I could see the arcing inside the neck of the CRT. Perusing the schematic, I noticed that one side of the tube filament was grounded, returning to a grounded supply lead from the power xformer, while the CRT cathode was sitting aroung 1800VDC. ???? 1800VDC from cathode to filament???? An open invitation for arcing. The fix was to lift both the grounds, the xformer lead and the tube filament lead, and run an insulated wire from the xformer to the tube socket, eliminating that close-proximity to 1800VDC. I used it for years afterward and it never arced again.

Maybe you have a similar situation.

Does anyone know of a source for dial drives that can be used with
air variable tuning capacitors.

3784. Greenlee Chasis Punches for sale

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-31 00:00:00 UTC
From: hmn <w2ufo@banet.net>
Message-ID: <381CE879.64AFE5CB@banet.net>
Source record: 65956

I have the following Greenlee punches in their original individual
packages. I will only sell these as a set. I WILL NOT break them up.

1 pc 2 3/4"
2 pcs 1 1/2"
2 pcs 1"
1 pc 1 1/4"
1 pc 2 1/4"
2 pcs 5/8" round
1 pc 5/8 " square
1 pc 7/8"
1 pc 1 1/8"
1 pc 3/4"

price for all above $250.00 + shipping. Please note the carton holding
all above is not very large but pretty heavy, so I suggest anyone
purchasing these should request UPS shipment (You pay the freight).
Payment accepted as bank check or postal money order only.

3785. Help...I need Pot!

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-10-31 00:00:00 UTC
From: Lee Smith <ckvnfm@mb.sympatico.ca>
Message-ID: <QZ6T3.354$Gd6.14856@news1.mts.net>
Source record: 65957

Hello Folks:

Now that I have your attention with the curious header...I am in need of a lead to the manufacturer of a pot that is made up of various sections stacked up with a switch on the rear. I am restoring a piece of broadcast equipment (Howe model 7000) and many of the rotary pots are worn out in the switch that takes audio into the cue system.

On the back is the info:

A-B
Mod Pot
Mexico

Can anyone tell me who made this, and if there is a website or address I could write to?

Regards,
Lee Smith

If you do a search of the Internet on "radio mods" you will
discover many sites with details for many different radios.

Among my favorites is:
http://www.mods.dk/search.htm

You might also try these Ham-specific search engines and sites:
http://www.qth.com/stamper/search/bafoof.htm
http://www.geocities.com/CapeCanaveral/Hall/8701/hamlynx.htm

WHAT A LIE! I assume many of you got this in personal email too. I complained about similar email eight months ago - and I was SPAMMED again. Only this time, the Virginia Anti-SPAM law applies and I can sue the sender.

The KBK.Net address is not a valid user name according to mail I received back. This message was actually sent from news1.ucsd.edu.

I suggest everyone receiving this SPAM complain to the sending system. For this Usenet message, complain to abuse@ucsd.edu. For private email SPAM, you will need to complain to the sending system. You can determine this from the IP address.

By the way, filing lawsuits against SPAMMERS is _extremely_ effective. My thanks to Virginia for passing their Anti-SPAM law. Check it out if you are a Virginia resident.

"CHAPTER 905
An Act to amend and reenact 8.01-328.1, 18.2-152.2, 18.2-152.4, and 18.2-152.12
of the Code of Virginia, relating to personal jurisdiction; Virginia Computer
Crimes Act; unsolicited bulk electronic mail. "

Hi,

does anyone here use the simulation program APLAC? It is said to be a professional universal simulation program especially suited for RF (including harmonic balance). There is a restricted (number of components < 12) demo version available. But as the demo is more than 12 MB I'd like to know whether the program is worth beeing downloaded.

Peter

Hi all

Is there now any equivalent type for old Siliconix Vmos-fet VN 88
(TO-220 case) for HF amplifier construction.
This is 90V 1.6A device.

MRF 134 would be otherwise useful but at much higher cost.

Thanks,
Kari

Hi Peter,

>does anyone here use the simulation program APLAC? It is said to be a
>professional universal simulation program especially suited for RF
>(including harmonic balance).

I use Aplac at home for all my amateur experimentation simulations,
except for low speed transient and DC response, where I use
MicroCap Demo. It is an excellent program, and the manuals
are very detailed and available for download too.

>There is a restricted (number of components
>12) demo version available. But as the demo is more than 12 MB I'd like to
>know whether the program is worth beeing downloaded.

I don't know what version of Aplac your refering to, but mine
has a memory restriction, not a component restriction.
You can get the latest from www.aplac.com.

The only downside is that it uses a node based text language,
not a schematic entry. Even so, its worth the extra
effort. Esp. for something thats free!

Regards,
Luke

3795. Need very low phase noise XO at 110 MHz

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-01 00:00:00 UTC
From: Tomas Ahrne <dirac@takethisoutalgonet.se>
Message-ID: <bhcT3.2178$0H3.15223@news1.online.no>
Source record: 65961

I am building a digital FM radio, and after some signal conditioning the signal goes to an AD converter clocked by a divided by 2 110 MHz XO (AD sampling frequency 55 MHz).

The S/N you get from the AD converter is very much dependendent on the clock jitter, and jitter and phase noise are closely coupled. The AD is 14 bits, but has an S/N of about 75 dB.

The formula for the resultant S/N when using a clock signal with a certain amount of jitter, t, and signal frequency, f, is:

S/N=20*log[1/(2*pi*f*t)].

A standard off-the-shelf XO might have a phase noise of -110 dBc at 1kHz away from the carrier. This gives a jitter of about 6.5 ps.

For broadcast FM, f is max 108 MHz. This gives:

S/N=47 dB.

So you see, I am ruining the AD converter SN.

S/N from jitter should be at around -80 dB so as not to degrade the S/N of the AD converter. For that I need jitter to be < 0.15 ps, a factor of 6.5/.15=43.3 better than what I have.

This would mean that I need the phase noise to be 20*log(43.3)=32.7 dB better. I know that the calculation between jitter and phase noise is more complicated than this, but this is a rough estimate.

Can anyone help me with a design or have pointers to web sites or know of a good book, etc.

Best,

Tomas Ahrne

As a matter of fact, Amazon themselves spammed for quite some time. They
stopped only grudgingly and stipulated their right to start again at any
time, if I remember correctly.

You could make a temporary "fix" to the tracks of pots that have a "dicky track". Clean off the track with solvent then scribbe on the track surface with an HB woodworking pencil. Use a 2B pencil for pots with a lower value.

100's of winter projects at Harry's Homebrew Homepage http://sm0vpo.8m.com.

I have done a lot of updating recently and included a 4-watt AF amplifier as well as coil-winding using PCBs so that anyone can wind the same coil! Not an easy task, remember Harry's laws?:

1 - No two people can wind the same inductor with the same instructions and materials.
2 - Coil winding data is a constant that varies from person to person.

Of course, the article is illustrated with photographs of a 20uH inductor (+150pf = 4MHz).

There are loads of antenna projects, transmitters, receivers and even a little booze, if you think "homebrew" has another meaning.

I have my own message board which is in daily use by home constructors with problems or suggestions. If you could help to answer some of the questions there I would be eternally gratefull.

best regards from Harry - SM0VPO

It should work with a signal picked up via an oscilloscope probe. It
even has a switch to eliminate the 50 ohm input load when using a
high-impedance source like this.

However, the signal amplitude has to be high enough to trigger
the input circuitry. Don't expect it to work on the microvolt-level
signals found in receiver input circuits.

3811. IF filters

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-01 00:00:00 UTC
From: Shawn Upton <supton@eece.maine.edu>
Message-ID: <381DB8F3.41C6@eece.maine.edu>
Source record: 65977

Hi all,

In the near future, for a nice homebrew project, I'd like to use some sort of decent SSB IF filter. Where do I get 'em? I mean, DigiKey has 10.7/455 versions, but I kinda doubt that a cheap little package like that will work well for SSB. Or would these filters work well with tuned coupling circuits (is that what all the IF cans are for?)?
Thanks.

I have not used Aplac yet but according to the Version 7.5 Evaluation Manual, there is a schematic input capability using Aplac Editor. Back in the Version 6.X days they had a separate program for schematic entry called NASSE.

I beleive that Aplac is "semi" independent these days since they have their own web page and they are called the APLAC Solutions Corporation.

Check their homepage at http://www.aplac.com/

Hi,

Below is the latest index of L.O.S.A and you can download the
complete L.O.S.A from the following places...

WWW:

http://www.hth.com/losa/

FTP:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

1.0 What is L.O.S.A all about?

This list was started back in -95 when I heard about (more or less)
uniqe problems that was solved by using a BASIC Stamp. Especially Guy
Gustavson's story (see #001) about how he saved his beloved cat Kesha
gave me the inspiration to start writing L.O.S.A. I hope Kesha still
is alive and having a great life. Now 4 years later there are 150+
applications described and I hope you will enjoy reading all (or
parts) of them.

The main purpose of this list is to get an idea of what other people
are using their BASIC Stamps for and maybe get some inspiration or
hints for your own projects. Some of the projects described in the
list also have links to source code and schematics for download.

1.1 How can I contribute to this list ?

If you have done something (big or small) with the BASIC Stamp that
you are willing to tell others please use the form given below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Visit the following Web site and fill in the contribution form...

http://www.hth.com/losa/

1.2 Why are some links dud's ?

Since people changes their e-mail and web addresses some links may be
dud's. If you previously contributed with one (or more) of the
applications please take a quick look and check your e-mail address

and/or web-links. I'm only able to keep the list updated if I'm
informed about changes, thanks in advance.

3814. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-01 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7vki4h$p29$1@news.hawaii.edu>
Source record: 65980
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

*rec.radio.broadcasting (devoted to the broadcast industry; moderated)*
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6O
(rec.radio.amateur working-group)

*It's been sadly reported that the moderator was lost to us in an
automobile accident; the future of this newsgroup is not known. 73 Bill...

I *believe* Surplus Sales of Nebraska has some, but I could be wrong. Check their catalog at
http:/www.surplussales.com/
some stuff's not in the online catalog, so you might want to get the printed one. It's worth having.
(I have no connection to SSoN, other than having bought some RF connectors from them once.)

Dan's Small Parts, http://www.fix.net/dans.html, has reduction gear drives, and suchlike. Or at least he did when I last looked. Also no connection here, other than having been a satisfied customer.

Also, Small Parts Incorporated, http://www.small-parts.com, has an extensive catalog of mechanical items like gears and shaft couplings. You could possibly build the drive you want from stuff they've got. Their catalog is also a must have.

Finally, if you've got the space and the patience, you could make a reduction mechanism using some dial cord and old jar lids. There are some notes about this technique in the book "Build Your Own Intelligent Amateur Radio Transceiver" by Randy Henderson.

I'm sure there're lots of other sources out there. Places like Ocean State Electronics, and Antique Radio Supply (?) come to mind, but I don't have any experience with them. They both have web sites, I know.

good luck and best regards,
n. caruso kb1dej

I have engineered one by sliding a small rubber grommet over a large nail, and fabricating a couple of brackets with grommets as bearings to hold the nail. I mount everything so the grommet in the middle of the nail bears against the dial cord wheel found on many variable caps. This provides a *smooth* and >slow< drive for next to nothing.

Forgive me if this is not the proper forum for this but I am
actively seeking 3-4 skilled programmers who have strong
skills using C/C++ and Ada to perform hardware/software test
& integration. Experience using LabView, exposure to basic
RF Engineering and working with Satellite and/or
Communications systems a big plus. For further information,
please visit out web site at http://www.ess-us.com or
contact me directly at (480)348-3990

Thanks in advance,
Ron Bauer
Sr. Manager
ESS, Inc.

3818. Re: Radio Shack Frequency Counter ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-02 00:00:00 UTC
From: Raw Power Radio <rawpowerradioNOraSPAM@go.com.invalid>
Message-ID: <2750ac20.b931ab60@usw-ex0102-016.remarq.com>
Source record: 65893

I have that counter and I like it. It's a great little box for the price. But I should mention that it seems very sensitive to input signal amplitude; too much or too little will give you false readings. When using a 10:1 scope probe, I suggest adjusting the compensating capacitor in the probe until you get a correct reading. (Of course, you'll need to have an approximate idea of what your frequency is in the first place!). When you change frequency, you might very well have to readjust the probe.

Message-ID: <0221c012.bab47dfd@usw-ex0102-016.remarq.com>
Source record: 65894

I have a bunch of 6146Bs laying around, and I'd like to build an RF amp. If anyone has schematics for amps for the bands listed in the subject line, please let me know. Links to schematics online are especially appreciated. Thanks in advance.

PS: I didn't know the 6146 could be used at VHF, but my old Sylvania manual says it's good to 175MHz.

According to NIST Special Publication 432:

"...the received accuracy is far less due to various propagation
effects. The usable received accuracy is about 1 part in 10 million
for frequency (1 x 10^-7) and about 1 ms for timing..."

It's on the web at:

http://www.boulder.nist.gov/timefreq/pubs/sp432/sp432.htm

Am I showing my age when I mention that I actually own a paper copy
of SP432? :-)

3824. Re: Using WWV (HF) as freq ref?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-02 00:00:00 UTC
From: Dan Rae <rae4@ix.netcom.com>
Message-ID: <381F114D.A95CF4CC@ix.netcom.com>
Source record: 65899

Tom,

I did do some experiments using my Racal RA1772 which has all the Local Oscillators brought out to the rear panel and a second slave "receiver" of some considerable negative gain consisting only of two mixers and the appropriate IF filters. Feeding the slave with my local 5 MHz standard and using the main Rx tuned to WWV at 5 (or 10) Mhz, and comparing the 1.4 MHz If outputs of the two rx's on a double beam scope, I was able to get an instant picture of how the path was varying between southern California and Colorado.

The results were interesting, and fascinating to watch. Between about 1 PM and 4 PM local time, there were quite long periods when the path seemed to be amazingly stable, and it was relatively easy to get within 1 part in 10E 7. You could actually watch the phase variations as they were happening, the difference between early morning and mid afternoon, was like looking at an ocean water surface during a storm and then again on a calm day. The water analogy seems right when you look at the scope. I guess you are looking indirectly at the D layer surface. I could have hooked the IF outputs up to a Vector voltmeter and even plotted the phase, but it seemed that you could estimate the overall phase drift of the local standard much better by eye. With a lot of practice and some luck you might get down to 1 part in 10E8 that way.

For home lab use the best off-air standard is still (while it lasts) Loran-C, with accuracies down to 1 in 10E11. WWVB with a lot of time and the appropriate gear, can get you down to 1 in 10E9.

Then of course there is Brookes Shera's well known GPS unit, which will, when attached to an oven of reasonable quality will give you almost Cesium levels of accuracy. Details at http://www.rt66.com/~shera/

But all in all I still like my BC221,

73, Dan AC6AO G3NCR

3825. Specs for General Radio 874-LAL?

Thanks.

Yes these oscillators could easily do the job. They look expensive, though.

I'll check them out.

Any suggestions for something less expensive, or something I can build
myself?

Best,

Tomas

Some of the older ARRL handbooks have a 2 meter amp using 2 of the 6146b tubes. They were used in lots of older comercial 2 way FM rigs on the VHF band.

That SP 443 is older than my SP 559 but it also says to expect
an accuracy of 1.00E-07

I am using LORAN and I think I can keep my local standard (Crystal)
at 1.00E-10. I can do better but my receiver has variable delay
so I don;t trust the additional accruracy.

Ain't that the truth. The *concept* is described beautifully. But all we really know is that he's charging humongous (for the frequency) capacitors directly from the input, whatever amplitude (< 4V) that might be at. I can only picture doing this with a huge gain block between the antenna and the detector; however, if 4V is the max input to the detector and he claims 111 dB dynamic range, all I can make of it is to guess the MDS at the detector input is 11 uV. If I haven't messed up the calculations and -136 dBm is 0.16 uV, that's a gain of 70 (less than I would have thought necessary) in a damn nice preamp.

Why does he call it a "product detector" over and over when he explicitly says "it is not really a mixer, producing both sum and difference frequencies, but rather is a 'switching integrator'"? As I understand the term, a product detector is a multiplier and can't help but produce sum and difference frequencies.

3833. Re: Need very low phase noise XO at 110 MHz

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-02 00:00:00 UTC
From: Tom Bruhns <tomb@lsid.hp.com>
Message-ID: <381F3551.44DF107A@lsid.hp.com>
Source record: 65908

Hi Tomas,

I'll give a ref and circuit for an oscillator, but first, I want to observe that, if I read your posting right, just taking the numbers at face value without thinking about what they might actually mean, I wonder if you are asking more than you really need in the way of s/n. If you sample at 55MHz, you have a very over-sampled signal, and you should get a LOT of processing gain by the time you get to audio bandwidth. For example, delta-sigma ADCs turn a very over-sampled one-bit ADC at, perhaps, 5MHz, into 20 bits worth of audio bandwidth. Even without noise shaping, I would expect you would end up with a better audio snr in the receiver than you will be able to get over the air from any commercial stations. OK, that is NOT an excuse for not doing well with the oscillator, but just a comment that perhaps you don't need things to be quite as good as you might have thought.

As for crystal oscillators...I should test some of the little XO modules and see how well they really do. But in "Ham Radio" magazine, Nov. 1977, there was an article which covered some low-noise oscillator circuits. (Sorry: I have a copy only of the oscillator part, and not the first page(s) which covered other receiver design issues, and therefore I don't have the title or author...but it's around page 38-41.) They gave one for a 5MHz XO. I assume it will work at higher freqs, at least some of the ideas. From the article, "...As a general rule, when designing oscillators, use the following guidelines: (1.) Oscillators should always use two stages: one operating in class A, and the other operating as a limiter. The limiter is also used as the feedback part ... . (2.) Circuits which have agc applied to the oscillator transistor should be avoided because the agc will likely add noise. This is discussed in detail in reference 6. ... " Note: Ref 6 is also the ref for the following oscillator circuit. The ref is: M. M. Driscoll, "Two-stage Limiting Series-Mode Type Quartz CRystal Oscillator Exhibiting Improved Short-Term Frequency Stability," Proceedings of the 26th Annual Symposium on Frequency Control, Ft. Monmouth New Jersey, 1972, page 43.

Here's the oscillator, in Spice-ish netlist form. That is, numbers following reference designator are node numbers to which it is connected:
V1 1 0 18volts (Input DC power)
L1 1 2 390uH
C1 2 3 3.3uF
C2 3 0 3.3uF
R1 3 0 75kohms
R2 3 1 27kohms

R3 1 5 1kohms
Q1 5 3 6 2N2222 (collector, base, emitter)
X1 6 7 5MHz crystal
C3 7 0 ??30pF trimmer capacitor, to adjust osc freq
L2 6 8 330uH
R4 8 0 620ohms
C4 5 9 0.01uF
R5 9 0 20kohms
R6 10 0 75kohms
R7 1 10 62kohms
C5 10 0 3300pF
C6 1 0 33uF
Q2 11 10 9 2N2222 (collector, base, emitter)
R8 11 4 50ohms
L3 2 4 10uH
C7 4 0 15-60pF trimmer
C8 4 13 43pF (output coupling capacitor; output from node 13)

Claimed performance is about -118dBc at 1Hz from "carrier", with a floor below -160dBc reached at about 3kHz from carrier. The text says the circuit may be used with either fundamental or overtone crystals. The article also shows a narrow crystal filter/amplifier for "cleaning" the output of an oscillator which might, for example, be optimized for low drift rather than low noise.

Cheers,
Tom

3834. 850-900 MHz RF Transistors - Anyone used them at other frequencies?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-02 00:00:00 UTC
From: rjburden.spamtrap@bigpond.com
Message-ID: <381f4d00.85712@news.bigpond.com>
Source record: 65909

Hi all,

I have a number of rf power transistors from mobile phone base stations ie 850-900 Mhz, around 30W out. I suspect I can't use them at other frequencies due to internal matching networks, but can anyone confirm if they have used such transistors at 70cm or 23cm?

Typical type numbers are E626P, E625P, TP3024A.

Many thanks,
Richard VK5OO

3835. Re: Using WWV (HF) as freq ref?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-02 00:00:00 UTC
From: Tom Bruhns <tomb@lsid.hp.com>
Message-ID: <381F541C.E6CFA9E4@lsid.hp.com>
Source record: 65910

My thanks to Laura and Bill for their postings.

One of the things I'd like to try to understand better and put some bounds on is the propagation effects from WWV. In an initial experiment, I could easily see the peak of the carrier distribution within better than 0.1Hz at 15MHz, with sidebands which aren't necessarily symmetrical (due, undoubtedly, to propagation effects) within one or two Hertz of the carrier. Even with a really terribly antenna (signal not as far above noise floor as I'd like), the sidebands are down tens of dB at 1Hz offset. So it seems like with a decent signal, I can measure it quite a bit better than 1 part in 10^7; but over the course of an hour, say, at mid day, what maximum average frequency offset should I expect, due to (more-or-less continuous) path length change over that time?

What techniques do you use to monitor Loran? Is that the Loran on 100kHz? Isn't it pulsed? Why choose that over WWVB? Does anyone out there have experience using one of the stations like NLK (Jim Creek Naval Transmitting Station; a wavelength or so away from me) as a frequency reference (given that they do move their frequency around sometimes...)?

Pardon all the questions, but I'm curious about what I can do with some new "toys." The ability to quickly measure with 4mHz resolution or so at 10MHz (and above) is fascinating, though I'm sure I'll soon tire of the novelty.

Cheers,
Tom

I'll have to play with it a bit, but I think the sensitivity can be
somewhat better than 11uV. Maybe Harold Johnson will chime in with some
info...I think he's played with them a little.

You could say that it (the sampling) does produce sum and difference
frequencies, but an integral part of the design is a filter (the
capacitors) that really kills the sum frequencies. Imagine replacing
the capacitors with little bandpass filters, all the same, all tuned to
the sum frequency, +/- their bandwidth. Then you get out the sum, not
the difference.

I heard that there was some patent interest in it, and that may be why
it's a little hard to find very much solid detail. Switched capacitor
filters like this have been around so long, I'm surprised that/if nobody
has used them for the down-converter application before. I think you
can accurately view the filter (essentially the same as the
down-converter topology, 'cept the output is taken at the switch common)
as a down-converter, filter, and up-converter (back to the input freq).
I recall thinking of them that way when introduced to them in the early
'70's. In fact, there are some VERY similar circuits that have been
used for FM stereo demodulation (product-detection, really) for quite a
long time. But...it may indeed be that nobody else had actually used
the switched-cap filter topology [slightly modified] for just the
down-conversion before!

Cheers,
Tom

as long as the voltage is below the rating of the counter, and in the
frequency range, and the correct impedance setting is chosen, go for it.

Ib,

If hp cannot still sell you one, (Part Number 08556-00013), and in the US we are lucky enough to have a free number to call, then the easy solution might be to subtract 20 dB from the indicated levels on the standard knob, it's not that difficult :-)

I f you keep on posting at the current rate (5 today by my count) then maybe some kind soul will find a knob for you, you never know :-)

My Loran receiver (home made) uses a voltage controlled oscillator
at 1.00 MHz. I use that osc.. to generate a pulse at the LORAN pulse
rate. I then use a sample and hold to sample the received signal.
After ,of course, amplification. If the zero crossing of the signal
is centered in the pulse the the out put of the sampler is zero.
Any deviation in the sample output is amplified and used to control
the oscillator. I use a scope to initially lock on to the signal.
The divider chain to generate my pulse is programmable so I can
change it to align the local pulse with the LORAN pulse.

I built this because at the time I had a very strong LORAN signal
and the WWVB signal was weak. I intend to build a WWVB receiver "soon".

One thing you should look out for is accounting for the instability
of your receiver.

How do you know that the variations you see aren't generated by your
receiver.

I know that people who want the ultimate in frequency standard calibration via radio broadcast use WWVB at 60kHz because of the stable propagation delay. But what sort of accuracy can be obtained by careful use of WWV on HF, at ~1000 miles distance? Over a period of, say, an hour during mid-day, what is the maximum frequency offset to be expected because of continuous path length change during that time? What other errors should one look out for?

Cheers,
Tom

It's come up here a number of times, but while people have asked
questions about it and made reference to it, there hasn't been a
lot of discussion about it.

Earlier this year, someone asked, and I did a websearch, and
found a number of references. I never got around to posting the
URL's or some comments that I had at the time. I even dug up
some related references in the ham magazines.

Anyway, I just did another websearch and nothing new has turned
up, at least not with my keywords and chosen search engine.

The first one below is from Tayloe himself, and is the most informative.
The rest overlap.

Linkname: Tayloe MIxer
URL: http://www.extremezone.com/~ki7mn/tayloe.htm

Linkname: [BPSK] New Mixer Design by Dan Tayloe
URL: http://www.qth.net/archive/bpsk/199810/19981022.html#0

Linkname: RE: [BPSK] New Mixer Design by Dan Tayloe
URL: http://www.qth.net/archive/bpsk/199810/19981031.html#0

http://www.qth.net/bpsk-digest.archive/v01.n060

I did search dejanews, how I hate the way it's rearranged itself,
and I don't see any references to it other than those that took
place here, none of which wsa really concrete information.

There are some types of XO that force the output signal to pass by the crystal itself. The latter filters out the signal sidebands. So, the crystal must be of the best quality as possible, preferable inside a vacuum sealed case.
The book Digital PLL Frequency Synthesizers, Theory and Practice, by Ulrich L. Rhode, has much info on low noise XO, including references.

I wish to create several small ear peices that fit on the ear and are tranceivers. I want the tranmissions to be full duplex with as little background noise as possible. Basically they should function just like as if using two cordless phone only without the phone line and should be extremely smaller.

My question is if this is even possible without spending hundreds of dollars per unit. The size of the unit should not exceed 1sq inch.

Sincerely,
Pirahna

From: Jim Pennell <spam@nospam.com>
Message-ID: <7vrb9accf1@nntp8.atl.mindspring.net>
Source record: 65847

Looking in the recent ARRL handbook, I found a low noise 5 MHz oscillator design that appears to use, and improve on, the ideas Ulrich Rohde mentioned in the Nov 1977 article.

This same technique which uses the crystal as both the frequency determining element and a filter for the output signal was used in a recent article in QEX regarding phase noise measurement methods. This design was for a 50 MHz crystal, although the same method may be applied at 110 MHz just as easily.

The QEX was this year, but I do not have the issue here in front of me.

There was also a design for low phase noise 125 MHz oscillator as an APPNOTE to go along with the AD9850 DDS chip. It can be found on the Analog Devices website:

Hello again,

Well, after hard work (and the help of Chip directory,
http://www.hitex.com/chipdir/chipdir.html) I managed to idetify this
chip as a Mitsubishi part. I've even found similar parts with almost
identical partnames (+/- one digit...) even with several identical pin
names, which means I'm on the right track...
Reminder: this is a 20pin SSOP chip, RF synthesizer with serial input.
I need the full data sheet to program it.
So, is there anyone on this newsgroup with access to a Mitsubishi RF
catalog or other info source, to help me get the full data sheet
(better yet, to give me a pointer to a web site with proper PDF file)?

Thanks and best regards,
T-man

Try putting hp8556a into alta-vista. This will return
many second-hand dealers. One may have the knob.
If you can remember the 20dB factor, the knob isn't
really needed.

Hi Will,

No, he has been remarkably quite. No doubt he tried to use his "wasta" to do something but failled. I should have copied him the Heathkit linear and HF TX and charged him for it!

Interesting that I have had yet another request from a different source, the guy wanted electronic info to build an induction fornace. He said it would be of benefit to us "hams" since we could then make custom aloys. In all my years in hamradio I have always tried to avoid melting metals in my shack - success rate approaching 99%! You can read this yourself if you look at the message board.

I intend to sample the whole 87.5-108 MHz spectrum in one go, not at the IF stage. That's when you need all the S/N and SFDR (Spurious Free Dynamic Range) that you can get.

Suppose you can get an S/N of 75 dB at the AD converter. By down conversion you get processing gain, and the formula for calculating it is PG=10*log(fS/fB), where fS is the sampling frequency and fB the resultant baseband frequency after down conversion. You might get another 30 dB, which gives you a total of 105 dB. Then, FM demodulation might give you another 10-15 dB, maybe more. A total of 115-120 dB, so what's the problem?

Well, you will lose a lot of it.

1. The above figures are theoretical and will probably not be that good.
2. I haven't taken the analog frontend into account.
3. The above calculation assumes only one radio station in the whole FM band. Maybe in Lower Slobovia, but certainly not in Stockholm. I see that I

didn't mention the fact that I am designing a wide band receiver and not a narrow band one in my original post.

Let us suppose that there are 10 stations of about the same signal strength and that I am interested in the 11th one, which is 40 dB down relative to the other ones.

In order not to overdrive the AD I need to have headroom to allow for all radio signals to superimpose. Sine we are not talking about noise, but very deterministic signals, they will add up as 20*log(N) (at least if Murphy has his say), where N is the number of equal strength radio stations. With N=10, as above, the headroom needs to be 20 dB. Then, if the station of interest is 40 dB down again, its peak amplitude will be 60 dB down at the input of the AD converter.

Now I only have 115 to 120 db-60 dB=70-75 db left. Not good, not bad, but certainly not excellent.

Best,

Tomas

3867. Re: 850-900 MHz RF Transistors - Anyone used them at other frequencies?

Hmmmmmn, I have a load of these devices and yes they do work well at other frequencies. I have used them in a 2-stage linear for 144MHz and even experimented with them in the HF PA covering 1.8 - 32MHz. With those devices you can simply regard them as a do-it-all power transistor. The only downfall is that any design you come up with will be of no use to others due to the cost of these devices.

best regards from Harry - SM0VPO

Agreed about Litz wire. According to Terman, not much real advantage above
1 MHz due to stranding irregularities and inter-strand capacitance. BTW
have you ever tried BUYING the stuff?

Taking up a previous thread, the interesting thing to me about silver, is
that most "real" RF engineers claim that it's a waste of time polishing
silver plating to remove the tarnish. The argument seems to be that
although silver oxide /silver nitride are both insulators , the layer is
only a few molecules thick and so contributes very little to the total
skin-effect resistance, despite being located in the very worst position.
Anyone got any comments?

Personally, I still like to see those cavities shine!

Keith

Yeah - that makes perfect sense, now that you mention it. The oxide
is an insulator, so would probably have a negligible effect, even if
it's really thick - think of a silver-plated wire with a pvc jacket-
the jacket isn't going to affect the conductivity at all!

Just for completeness, the article is "Effects of Noise in Receiving Systems" with a blurb: "A discussion of the many types of noise which affect communications receivers, including external noise, noisy local oscillators, and noise IMD" It's by Ulrich L. Rohde himself.

I'm sure I first saw the other trick suggested, taking the signal off one side of the crystal so it acts as a filter, in another of Rohde's articles. I think it might be the June 1975 issue of Ham Radio, in an article entitled "Stable Crystal Oscillators", but I don't have the article handy and the specific article is a guess based on a vague memory and an accumulative index.

Questions referenced to HF receiving systems.

Please explain 3rd order intercept point.

What is a decent 3rd order intercept point for an amp?
How about a "great" 3rd order intercept point for an amp?

Same for a mixer--decent 3rd order?
great 3rd order?

How about 3rd order intercept of a receiver?

Thanks
Mike

>receiver.

Well, the "receiver" runs from a pretty good reference oscillator. In fact, it's that reference that I want to calibrate. The phase noise of the receiver is also pretty good: I can look at another reference oscillator, and things are -100dBc at 1Hz offset, and the freq is stable for hour sorts of periods to probably one part in 10^9, maybe better.

I let it "watch" WWV on 15MHz this afternoon for a while. With one hour averaging, the sidebands were nicely symmetrical at -40dBc at 1Hz offset, and the center was pretty stable, better than 0.1Hz. Next time I have a chance, I'll do a peak-hold, and watch for drift. But in any event, either the received WWV signal drifted the same direction as the receiver, or the received signal this afternoon for a couple hours was stable to well within one part in 10^8. If I could get a clean enough signal and KNOW that the propagation was stable, I could resolve better than 4 millihertz in about six minutes. I'll see how that works against my good reference osc.

I'm curious about WWVB...at 60kHz the equipment I design at work can resolve phase differences around 1 millidegree in just a few seconds, so _IF_ I can get a good enough signal, I should be able to rather quickly calibrate to near the broadcast accuracy. Have to try it first on the Jim Creek signal, which should be quite a bit stronger than WWVB here. :-)

Cheers,
Tom

Had no luck with Antique Electronic Supply,they sell dial pulleys and cords, I did some digging around the house and am having some good luck using some old large press fit knobs that I have glued rubber too. I then took a wood pencil and glued rubber to it, mounted all the above in a sheetmetal channel,and bam! it works good. I now just have to find some properly sized materials of good quality to make everything look as work as good as possible.
Thanks all for the replies and thanks Bob for getting for getting me to use my own noggin and hands.

Add Allied-Avnet, Pioneer Standard, Mouser, and JDR Microdevices to the list.

The pots from Jameco are pretty tinny. I would avoid these. The IC's are very competitively priced at Jameco, but Digikey has a better selection.

Be advised that some of the big guys have minimum orders.

3889. homebrew bfo's

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-04 00:00:00 UTC
From: weathrship@aol.com
Message-ID: <19991104103600.11361.00001016@ng-fr1.aol.com>
Source record: 65855

Hello you-all

I am now trying different types of bfo's at 455 kc IF.
I found one that is used in the 'autodyne' mode but
it is not one I am familiar with. The Hallicrafter's S120
uses it too. I would appear that the S120 uses the
same lineup as an AA5 style broadcast radio and to
get a cheap bfo, they simply switch in 470 ohms to
ground and remove the connection from the suppressor
grid of IF amp 12BA6 which normally sits at ground and
ties this to ground now thru about 2.5 K pot. It appears
that as this pot's resistance is increased, the gain goes
up for AM stations until it starts oscillating and then
adjusted for best SSB reception as it is now injecting
a carrier to beat with the sideband signal. It works, but
I cant figure out how the heck this introduces gain or
feedback into the 12BA6 thru a suppressor grid. I can
remove the ground connection to a suppressor grid without
any mods and of course the electron cloud the starts building
up around the plate/suppressor reduces the gain considerably,
the rig motorboats etc... I suspect as in references I have read
that I am probably no doubt having reverse current from the
electrons being knocked off the plate from the original high
velocity electron stream to the screen grid etc..

Can some radioman out there shed some light on this bfo
scheme for the rest of us? I cant find any reference to it in
about 8 books I managed to scrounge up, and suspect that
the scheme is cheap but doesnt perform like a real bfo.

Thanks

Pete: I don't have a lot of info, only whats given in General Radio Catalog R.

"874-LAL Adjustable Line An air-dielectric coaxial line that can be
telescoped to change it's length. Used in matching networks, as phase
shifter, and as a variabletime-delay element. Contacts are made by
multiple-spring fingers.

Connectors are locking Type 874.

Characteristic Impedance: Not constant --approximately 50 ohms when fully
collapsed, approximately 57 ohms when fully extended.

Adjustment Range: 25 cm

Physical Length: 33 cm (minimum) to 58 cm (maximum)."

Nice to see GR was using metric in a 1963 catalog. 73 Tom WB6IQD

> <snip>

Unfortunately, in the real world, there is no such thing
as a perfect linear amplifier. There is always some distortion
of the signal at the amplifier output. This distortion tends to increase
at the cube of the wanted signal. i.e. a 10dB (10 x power)
increase in wanted signal is likely to lead to a 30dB (1000 x power)
of the unwanted distortion products. The third order intercept is a
theoretical point, where the third order intermodulation products
(i.e. 2*F1- F2 or 2*F2 - F1) are at the same level as the
wanted signal.

>How about 3rd order intercept of a receiver?

A good receiver will have a third order intercept
of more than +30dBm (measured at the receiver input.)

A very very good receiver, such as the N6NWP front
end (QST Feb. 93,) will have a third order intercept of
more than +40dBm (10W!!!)

By all means: Digi-Key, Newark, Mouser, etc. Another fave of mine is Mainline in England.

You get exotica wherever you can get it. Like the fun I had tracking down some TriQuint parts in less-than-a-full-reel quantities last year.

Don't be afraid of minimum orders - use it as an excuse to arrange a group buy, or use it to stock your junkbox. Everybody needs things like .1 uF capacitors (I buy them by the hundred), and letting it be known that you have some spare MAR-6s or SBL-1s or whatever can be your ticket to instant popularity. :-)

Do you have any local possibilities? Here in Toronto I frequent outfits like Sayal and Active Surplus...erratic (sometimes chaotic) selection and availability, but decent prices.

Source record: 65862

Actually, second-order distortion increases as the square of the signal amplitude, third-order as the cube, fourth-order as the fourth power, and so forth. The reason that third-order distortion gets so much attention isn't that it's the only distortion product, or even the largest. The problem with third-order products is that some of the third-order mixing products (the ones Ed mentioned) of two nearby signals ends up at a frequency close to the two signals, so they can get through ordinary filters.

For example, if two signals are at 14.0 and 14.1 MHz, the second order products are 28.1 and 0.1 MHz, both easily filtered out in the early stages of a 20 meter receiver. But two of the third-order products are 13.9 and 14.2 MHz. So strong 20 meter signals can get through front-end filters and mix, producing spurious signals in or near the 20 meter band.

In a direct conversion receiver, second-order distortion is more of a problem. It can cause demodulation of nearby AM or SSB signals, or produce an audio signal which gets amplified. For example, two signals at 14.0 and 14.001 produce 0.001 MHz, which is 1 kHz -- audio. In a superhet, where the IF is at a radio frequency, this is filtered out. In a direct conversion receiver, all possible audio frequencies can't be filtered, and the problem of AM demodulation still remains.

I'm not an expert at this, so would appreciate corrections if what I said isn't accurate. I second Ed's recommendation of _Solid State Design for the Radio Amateur_ as a good source of information on this topic. Another source is Chapter 17 of the _ARRL Handbook_. You'll find both these books to be well worth their modest cost if you're interested in topics like these.

Hello,
This is just my experience. Others of you may have had better
dealings with RogRadCo.

I got billed on Sept 23 against my credit card for a Crystal Radio Kit.

This is the 4th of November. No radio. I got excuses about 'gee, it
got sent back with "no such address", I call the guy...seems nice, but
I get the feeling he is pulling my leg. He probably meant to send it
to me, but never got around to it. I wait. I wait a week. No radio.

So I call again. Before I can get two words out, it's "hold on..." I get
put on hold. Then the line hangs up. I call back, busy...busy again,
busy again... Finally two more calls result in his answering machine.

I can tell he's real concerned about my problem.

Just thought you guys would like to know who might encounter his
website and think you might get something for your $50.00.

Sheeeesh. I'm sorry if this is whining to some of you, but if we
let people do this, what's the point in having this homebrew newgroup?

We have to get our parts and kits and info on this stuff from somewhere.
I found his website from a homebrew/kit site. In 10 years of dealing
here and meeting a bunch of cool people and not having any problems
buying and selling and exchanging stories and helping others, I finally
got stiffed. I guess I'm lucky. But I had more faith in people. I'll
have to be gnarly and suspicious now. I hate that.

Some people's kids, huh?

Your radio pal, Tony

Those tubes were never intended for RF amplifier service but they would probably work okay as long as you don't try too high a frequency.

Use any circuit designed for 6146 tubes and you will be pretty close. See older ARRL handbooks. (Connect the suppressor grid to the cathode.)

I am using that exact arrangement. I connect the battery to the power supply through a fuse. The fuse serves to prevent discharging the battery - probably catastrophically! - should the power supply crowbar for any reason. The power supply output is a constant 13 volts which only trickle charges the battery. Turning the power supply off does not discharge the battery. This arrangement has been in use for a couple of years now. I have not found it necessary to switch the battery out of the circuit for any reason.

3909. ### SINAD Meter Homebrew???

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-05 00:00:00 UTC
From: wb4lnm@aol.com
Message-ID: <19991104194851.19609.00001143@ng-fn1.aol.com>
Source record: 65870

I don't think I've ever seen an article to build a homebrew SINAD meter for FM receiver tune up. Seems like it would be an easy thing to do - it apparently just needs a detector (AC to DC at audio ranges) to drive an analog meter, plus a notch filter at 1000 Hz. Seems like an idea project for a couple of op-amps. The least expensive commercial units I have seen run $300 bucks or so, which make it a bit ridiculous when you only need to use on occasionally. Anyone see any designs for a simple unit?

Source record: 65871

Does anyone have any experience building a linear amplifier with EL34 tubes? They have the control, screen and suppressor grid all broken out individually. In an audio circuit a pair of them are often good for 45-55Watts. I have a box of them, several 450V power transformers, 450V electrolytics and several high-voltage ceramic adjustable capacitors. I think there is a project here!

I have much experience in designing and building audio tube amplifiers but weak in the RF end.

Any advice appreciated!
Andy

3911. Battery Backup for Astron Power Supply

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-05 00:00:00 UTC
From: "Robert J. Dellicker" <rjd@ptd.net>
Message-ID: <0jsU3.565$9L.27024@nnrp1.ptd.net>
Source record: 65872

I'd like to use a battery that I have for backup of a system which is powered by an Astron RS-20M power supply. The battery is a sealed lead acid 24Ah type NP24-12FR from Yuasa-Exide.

The supply is overkill for the equipment running. (500mA avg, 4A peak)

My question is can I hook the battery straight to the power supply or should I have a disconnect circuit that switches in when I loose power or the battery needs to be topped off and switches out when power is on and the battery is fully charged?

If I need such a circuit where would I find schematics?

Please reply directly by email since I usually only browse the group when I'm trying not to burn down my house ;-)

Source record: 65876

Hello Bob

The answer is yes, you can use your battery and power supply together. There are however a few precautions - you want to put a series diode between the PS and Battery. Since you state your load does not exceed 4 amps I would suggest a diode with a current rating of aproximately 10 amps (bigger/larger is okay too).

The diode will protect the PS from discharging the battery when it is turned off, or in the event of a 115Vac power failure. By the way, it has been my experience that Yuasa makes one of the best sealed lead acid batteries on the market today. Egle Picher is also an excellent brand, but hard to find.

One other caution on sealed lead acid batteries, as the name implies they are sealed, however if the internal pressure builds up they will vent - from memory Yuasa batteries vent when the pressure differential reaches 5-7PSI. The way to avoid any internal pressure build up in the battery is too limit the charge current to less than 25% of rated capacity. In the case of your 24AH unit, that would be 6 amps. I'm conservative and use 10 to 15% (in your case that would be 2.4 to 3.6 amps). You can control the current by adjusting the voltage on your PS and watching the current meter. If your power supply has a fixed output voltage a one ohm (5 to 10 watt) resistor in series with the diode would limit the current, a toggle switch could be wired across the switch and when the current drops to an acceptable level the switch would short out the resistor. 13.6Vdc is a good float voltage for lead acid batteries. You may find a resistor helpful even if your supply voltage is adjustable as it will be easier to set and limit the charging current. There will be a voltage drop across the diode you are going to install between the PS and Batt, typical voltage for a silicone diode is 0.7 volts. You will have to adjust the PS voltage to aproximately 14.3Vdc for the battery to see 13.6.

I'm not sure about the diode, but the power resistor, switch, small project box, wire and lugs for the battery and PS should be available at Radio Shack.

Hope this helps, regards, Hugh KF6HHS

Two very good points!

You can't really get going as an experimenter until you have a stock of basic components, such as small resistors in all common values, small ceramic capacitors in 1nF, 10nF and 100nF, and common semiconductors such as 1N4148, 1N4007 and your favorite transistors and FETs. If you're always having to stop to order common parts such as those, your project will never take off. So, as Laura says, don't be afraid to buy more than you need and take the rest into stock.

Don't call it junk: think of it as stocks of good parts for future projects!

Also, you don't have to buy everything at new catalog prices. You pay the catalog distributors extra so that they can continue to keep every component you might ever need (and that's a fair deal). Surplus companies don't do that, so you pay less for whatever they happen to have. If you're always on the lookout for useful parts to take into stock, you can often find bargains at ridiculous prices.

For example, I'll never need to buy another 1N4003 again (or 1N4002 or 1N4001)... if only I could remember where I stored the reel...

3920. HBR-8-11 circuit Wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-05 00:00:00 UTC
From: "aaa@bbb.com" <aaa@bbb.com>
Message-ID: <3822B3E3.127DBEF2@bbb.com>
Source record: 65881

hi,

I am interested in building an home brew receiver HBR8/11 presented
on the web page http://www.inetport.com/~talen/

Does anyone have the circuit and coil winding details for these
or has the OLD QST articles mentioned there ?

These seem like interesting receivers to build, and am currently
thinking of building something similar using 4 * 6u8 tubes

tube 1 = 6u8 = Mixer and oscillator , converts to ist IF 1700 KHz,
with 2 tuned circuit filter for front end
may use the triode as a mixer and the pentode as the HFO to increase
dynamic range.
AGC may be implemented with In4007 diode attenuator

tube 2 = 6u8 = mixer oscillator converts from 1700 Khz to 100 Khz,
uses 3-4 tuned circuit filter built using T50-2 toroids at 1700 Khz.
AGC may be implemented with In4007 diode attenuator

tube3: = 6u8 = IF amplifier + audio amplifier, uses 4 toroids (1/2 88
mH telephone loading coils= 22mH each) for selectivity at 100 Khz, the
triode is a simple audio amp which can drive Hi-Z headphones
AGC may be implemented with In4007 diode attenuator

tube 4: 6u8 : grid (or Plate) detector and BFO for SSB

This should have about 40 db image rejection @ 10 -15 Mhz, and pretty
good selectivity
and sensitivity.

If one could get those 6az8 tubes for a resonable price, they would be
ideal to have as they are remote cutoff and can have AGC applied to
them. Also the 6u9 is an excellent tube with the pentode having gm =
12mMho and being Remote cutoff, but they need impossible to find 10 pin
decal sockets.

The audio statges may also have the selectojet audio filter to provide
some audio filtering
using 2 12ax7 tubes.

The speaker amp can be anything using a 6aq5 etc and so can the be PSU.

any ideas would be very helpful.

73s and thanks

Believe it was shown in Ham-Radio - 1977(?). I scaled it up to 12MHz
xtals for use with VHF/UHF beacons since 1978 (1000pF and 33 ohm to
ground), 0.2V RMS O/P, and still listening on 144/432/1296MHz the
output sounds extremely clean, much better than any other oscillators
I've listened to. Used with 2N2222, BC547 and BF199 transistors.

3925. HELP! Tube Guru's Advice Needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-05 00:00:00 UTC
From: Rick Haub <rhaub@midwestmicro-tek.com>
Message-ID: <382312CB.116D34B0@midwestmicro-tek.com>
Source record: 65886

About 4 months ago or so I posted a letter to solicit help on a 12BY7/1625 75 watt transmitter that I was building. I was anticipating passing my Novice exam and was building my first transmitter and reciever. I got a lot of good advice from a lot of good people. I'd like to thank Mike Silva, Doug Smith, Blake, Michael Tracy at ARRL and especially Jim N2EY for all of thier help and also the rest of you guys who contributed as well. And Bill N2CQR for all the help getting my MMX reciever on line.

It took a while and in the mean time I got caught up with other things but I finaly sat down with all of the posted advice and e-mails and GOT THE DARN THING WORKING! Not quite as well as I'd like but I used all the advice I got and I finally got the transmitter working fairly well. I'm getting about 30 watts output on 80m and about 35 watts output on 40m. It's a good, clear signal with very little (thanks to the transmatch) harmonics. My SWR shows a maximum of about 1.2 on the extream edges of my tuneing range. It's not the 50 watts that I was expecting but I can get on the air with it. Turns out that my final coils in the pi network where a bit off and needed better shielding. I shielded everything and now I'm getting a much stronger and clearer signal.

I got my ticket 2 months ago but I want to practice my code a bit more before I go on the air. I'm in an aluminum sided apartment house and because of how my antenna is situated most of my signal will be going North and West so if any one is interested I'll be at operating somewhere at 3.71MHz and 7.11MHz in a couple of weeks.

TNX!

The GPS receiver boards are gone. They are sold out. I checked with them Tuesday.

The company selling them was Electro Mavin located in Compton CA. Their web page is at: http://mavin.com/

You can find out what you and I missed on the page. There was mod information available on referenced sites for reading data via a serial port. The antenna was included too.

If anyone has a spare, please contact me.

Install a blocking diode mounted on a heatsink between the b+ lead of the power supply and the battery. Hook your rig directly across the battery outputs. The blocking diode should be good for about 50 amps continous. The reason for the diode is to keep the battery b+ feeding current back into the power supply when the power goes out.
Keep an eye out on the battery's electrolyte level, if the water keeps evaporating, lower the power supply voltage to about 13.3 vdc output or so. We use this scheme on our local repeater and have good luck with it.

Some random thoughts: I would think the output noise from the detector would be a problem when dealing at microvolt input levels. Tayloe appears to be hanging a couple of op amps off the "outputs"; I wonder how not only noise performance, but nonlinearities in those op amps will impact performance. Also, there's got to be some sort of AGC in there; if he just took the output from the 11 uV signal and amplified hell out of it, the audio would be pretty distorted for a 1 mV signal and beyond all recognition for that 4V signal. The AGC itself has to introduce some noise and distortion.

I'm thinking teflon caps here, maybe polypropylene. I think leakage and soak

It goes without saying that it'll be better in all respects if those op amps he's using are CLC425 instead of 741. :-) Undoubtedly, considering the nifty new analog mux he's using, he found some modern amps.

Any good on-line references to the theory behind switched-capacitor filters? Everything I can find, including the material in AoE[1], grabs a chip and says, "look, nifty! magic!"

[1] Not on-line, but someone's gonna point me there anyway. I went. Besides, AoE isn't fundamentally a theory book, nor meant to be.

Good point. I use a large 12v bulb, the resistance goes down as the
current goes down, so it charges faster than a linear resistor would,
yet still serves to limit the maximum current from the supply.

Another concern is to not run the battery much below 12v or you'll
harm it. Small relay triggered by a zener/NPN combination would do
the trick, and only use a few milliamps when activated.

Yes!

See you guys? It can be done.
And I'll bet Rick had a blast!!!

Thanks for posting your story here,
and I thank those other guys too for
adding and assisting. We all learned
something. I'm working with some
TRF and Superhet sets using valves
right now. I've got a 1625 or two in one
of my junk drawers and now, I'm excited
about the prospect of starting on that!!

Your radio pal, Tony

3931. Tube radios- AM, Shortwave for you beginners here

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-05 00:00:00 UTC
From: weathrship@aol.com

Source record: 65892

Hey you guys... I finally got my act together. I had so much fun
scratch building AM and Shortwave tube radios that I am about to
be able to sell them for those of you interested and dont want to
hassle finding the right parts. I found a way to handcraft the IF,
RF and Osc coils so you dont have to figure out how to nibble
away at aluminum, or put your chassis thru a milling machine to
mount the commercial cans. The IF coils are pre-tuned and adjusted
to give as much selectivity and fidelity as I can get from hand-crafting
them. They aren't as selective as commercial cans, I figure 20kc
bandwidth for AM is good, I am getting more than that, but these
radios do a pretty good job especially as a starting platform for teaching
radio basics without confusing people about depletions regions and stuff
right from the git-go and scaring them off. The only alignment is to the
local oscillator for setting the dial. I am offering experimenters the
handcrafted bobbins too so they can wind their own if they want.
I put these things in clear, clear blue and clear red acrylic and safe
enclosed cases. With instructions like heathkit, and how to build a
cheap isolation xformer, winding info, etc. If you are tired of just taking
parts like BJT's, inductors, resistors and stuffing IC's onto pc boards
without any idea why you are doing it, or how the circuit works, see
my website and have some real radio fun!

See: http://hometown.aol.com/weathrship/myhomepage/business.html

I thought about doing this just for the homebrew guys here at cost...but
it's a real pain stooping over and winding 412 turns of #30 magnet wire
4 times in a row and only make my money back, ha ha. If I can do this
on the side and pay taxes and come up with a few bucks to buy more
radios without my wife yelling at me (she's pretty loud) for spending money
on my goofy geeky hobby, then so much the better.

See ya,
Your radio pal, Tony

Well...I think the op amps should be low distortion, but they don't need to be particularly fast. The signals on the capacitors should not be changing very quickly: the capacitors are supposed to act as a very serious lowpass filter, and indeed must be chosen to set a corner frequency around 3kHz, if that's the bandwidth you want. Seems like there's no reason to not put in additional rolloff going into the op amps, if the low 6dB/octave rolloff of the single lowpass is a problem.

You don't HAVE to have AGC, though it might be a nice convenience, just as on other receivers. (Actually, to keep the I and Q channels balanced, I'd prefer to NOT use AGC and just have wide dynamic range in the amps.) Good audio op amps are capable of pretty wide dynamic range: run on +/-15V supplies, they can output over 5 volts RMS. If the gain is *10 (20dB), and the input-referred noise is 5 nanovolts/rtHz, then the output noise from the amplifier is roughly 300 nanovolts in the 3kHz bandwidth, or more than 140dB below full output. With an amp like the AD797, or the Burr-Brown OPA627, the distortion products can also be on the order of 140dB below a 5-volt output, if you're careful with the design. (Real fun to try to measure that at home.) Even "garden-variety" audio amps like the NE5532 should be pretty decent. Of course, if you have interferring signals within the audio passband, your ears may have some difficulty separating a weak desired signal from the strong interferring signal.
>
>I'm thinking teflon caps here, maybe polypropylene. I think leakage and
>soak

Seems like no reason to not use polyprops...select a low-inductance design. I've never found a reasonable source for Teflon caps but would like to know of any. Certainly nonlinearities in the switches themselves would be worse than most of the capacitor effects...but I would be really careful to avoid HF resonances in the caps. I'd try surface mount NPO ceramics if the capacitance needed wasn't so large.

>

>
>Any good on-line references to the theory behind switched-capacitor
>filters? Everything I can find, including the material in AoE[1], grabs a
>chip and says, "look, nifty! magic!"

Dunno about online refs. If you assume perfect switches, I don't think it's too hard to see what's going on: act like a lowpass filter for 1/4 cycle, then "hold" since the input is disconnected. If the switching is 'zactly synchronous with an input sinusoid, the value on the cap will be the average of the voltage during that time, eventually, plus a little ripple at the input freq. One could write the equations and solve them, or let Spice do it. -- One problem looking for refs is that there are several very distinct things that folk call "switched capacitor filters." Be careful to not get the wrong topology.

Cheers,
Tom

It's regeneration, just like in a regenerative receiver/detector.

Feed some of the signal back into the input. The IF stage is then
on the verge of oscillation. Selectivity increases, just as with
a regen receiver or a Q-Multiplier. Increase things enough, and
the stage goes into oscillation, providing a beat signal at the IF.

The advantage of this is that it doubles or triples the use of the IF
amplifier, and requires no extra tubes. A significant something in
a cheap receiver.

The disadvantage is that it doesn't give good skirt selectivity, and once the tube is in oscillation, selectivity suffers. Also, because the tube is both amplifying and oscillating, it must affect strong signal handling of that IF stage. And of course, since you aren't using a product detector, the receiver suffers as much as any receiver used for CW and SSB that lacks one.

I don't kow enough about tube operation to properly explain the circuit. But I'm wondering if the schematic doesn't show something? Old ARRL Handbooks had a bit about putting IF amplifiers into regeneration for selectivity, and they mention a small capacitance from plate to grid, usually in the form of a "gimmick" capacitor, just two pieces of insulated wire twisted together, or even just by bringing a piece of wire connected to the plate near the grid. That perhaps isn't shown on the schematic, but exists in the receiver.

You don't need MORE gain to put a stage into oscillation. You need enough feedback, and then controlling the gain determines whether the stage is on the verge of oscillation, ie selective, or actually oscillating.

The June 1971 issue of QST has an article about tunring an All American Five into a shortwave receiver. After adding an isolation transformer, it puts a transistor converter ahead of it, puts the IF into regeneration (with a piece of wire providing feedback, and a pot in the cathode to control regeneration), but it uses a separate transistor BFO.

Somewhere I thought I had the circuit used in some other cheap Hallicrafters receiver, but it's not where I thought it would be.

Pat Hawker shows the circuit from the SX140 in an older edition of his Amateur Radio Techniques. It's about the same as you describe, though it has a silicon diode going from the suppressor grid to ground (it's cathode at ground). However, the brief blurb says nothing about how it operates, and the schematic does not show any feedback from plate to grid.

I can't find the issue of Communications Quarterly with the article about renerative receivers. Since it's a good overview of the field, it might show such a circuit. Anything I can put my hands on without digging has very traditional regen circuits.

Obviously, the suppresor grid is being used to smoothly control regeneration, and without having to tamper with the circuit beyond taking that grid off ground.

My comment wasn't so much that information is limited, but how are
people finding out about it? Twice this year, people have asked about
it, and I've wondered why they'd know about it, but not have seen
details? A few other times, it's come up in passing in some other thread,
like the
name is common knowledge, yet nobody before this thread has actually said
anything in this newsgroup about it's operation or potential limitations.

On some level, attaching your name to a circuit gives it higher
recognizability, yet we are used to names attached to circuits which
have been around for decades. It doesn't do anything to describe
the operation, as all those oscillators named after people can attest.
When someone first asked about the Tayloe mixer here at the beginning
of the year, I sure hadn't heard of it, and assumed it must be something
I was familiar with, but under a different name. When I found a
reference, it turns out to be a circuit from a normal guy who appears
to have tripped over it by fooling around. Or at least, that's
the impression I got from the piece by the actual creator.

On some level, I can see some other things that might have been
teh basis of the idea, because I've certainly looked at certain

things and wondered about them in this area.

The obvious thing is using CMOS switches as mixers. I think I thought of it myself (no, I didn't invent it, only saw a possibility before I saw it described elsewhere), reading something about the MC1496 double balanced mixer, which uses the circuit now known as a Gilbert Mixer. I could see using CMOS switches as to do the function of the upper four transistors.

I might not have seen that myself, I can't remember, but I did at one point see a "robot voice" in an electronic magazine from England which used CMOS switches in a balanced modulator of some sort to create the same effect as a "ring modulator" used in music synthesizers.

And the April 1982 issue of Popular Electronics had a synchronous detector (complete with selectable sideband) which used CMOS switches as the product detectors. Each channel used a 2-input muliplexer, part of a CD4053.

A much more recent reference was in Communications Quarterly for Fall 1998, where a 74HC4066 was used as a ring modulator type product detector.

There must be other references, I"m sure I've seen some, but we haven't seen a lot of use of CMOS switches as mixers, which is surprising since they are cheap, though that says nothing about how well they operate.

Another thing that I had in the back of my mind was the circuitry used in coherent CW. I'm not sure I've ever seen a complete circuit. The portion I did see, and my memory is incomplete, had the incoming signal split into two sets of CMOS switches which were switched at the IF (or is it RF?) frequency, with the channels fed 90 out of phase. There are capacitors on the output; I can't remember whether I pictured
it as a sample and hold or a filter. You have a DC signal coming out of both channels which follows the incoming CW signal. It's not useable because it's DC, so it's fed into another set of CMOS switches/mixers, which are switched at an audio rate, again with both sides 90 apart. The output of those is an audio signal.

I remember looking at that and seeing a resemblance to the Third Method (or Weaver method) of generating SSB. When you've moved down to DC after the first set of switches, you've got two channels that are 90 degrees apart, and then when you remodulate it at audio frequency (the second set of switches) you get the second set of 90 shift.

But the Tayloe mixer is really has as it's basis the "commutating filter". I don't see that mentioned in the text in the references I gave. It was really clear the first time I saw that text.

The first time I saw a commutating filter was in the very first issue of QST I ever received, the April 1971 issue. "Digital Filters" by L.V. Gibbs. He only calls it a digital filter, but years later I learned it's true name. It's that whole thing of 4 switches, 4 capacitors, and a resistor in series at the input. It is one of the fuller articles I've seen in the hobby magazines about this type of filter. Of course, it was a long time ago, and the circuit he shows actually uses transistors to do the switching of the capacitors, and dividers made of discrete transistors (and on the final page, as filler, there's a bit from the ARRL museum showing a "triple spark gap" which somehow seemed so mystical to me at 11).

The filter is based on the operation of an RC low pass filter. But it's a bandpass filter. It's center frequency is determined by the clocking frequency (which ends up being a multiple of the center frequency because of the dividers needed to clock the switches in the proper sequence). I'm too tired at the moment to extract the place of the input resistor and the capacitors. Maybe I will later. The more capacitors 9and hence switches) the cleaner the output, to really simplify.

To get better skirt, you need to cascade more filters of this type.

One important thing is that it works like comb filter, in that it will also peak signals on all harmonics of the center frequency, except N (where N is the number of capacitors/switches) and multiples of N.

Don Lancaster briefly mentions the filter in his CMOS Cookbook.

73 for August 1974 has a "Super Selective CW Tracking Filter" using this type of filter, along with a PLL to so it tracks the incoming signal. It's less informative.

I don't have the date, but there was also a good article in Ham Radio around 1978 or so. I know the issue had Wes Stewarts split-band audio limiter on the cover, and I think Hank Olson wrote the article. His was more on practical designs, far more modern than the QST article, including using a crystal and a CMOS divider to provide the clock, and at least one example of cascading the filters. I don't remember how informative the text was, but it ranks up there with the QST article.

There wasn't much more beyond this. It seemed like such a nifty idea, yet nobody semed to do much with it. To this day, I wonder about putting it in the IF of a receiver, provided the IF is low enough.

But something about the clocking always made me wonder about it's application in phasing SSB. I don't think I ever had any concrete ideas, only thoughts that there must be some application.

I'm still thinking about how it's supposed to translate into the Tayloe Mixer, but it would seem that Dan Tayloe looked at the filter like

I did, thought about using it in other ways, and figured something out.

I hope this helps set the background, or maybe will give somebody an idea to try along different lines.

Michael

3937. Re: HBR-8-11 circuit Wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-06 00:00:00 UTC
From: blackm00@cam.org
Message-ID: <blackm00-0611990236330001@dialup-633.hip.cam.org>
Source record: 65753

It's not clear whether you want to build the receiver, or just use
parts of it. One thing that made the HBR receivers standout was that
they were intended to be duplicated. Ted Crosby designed them to
be copied, and put plenty of effort into the articles (and supplemental
material) so people could copy them exactly. In fact, if you read
some of the articles, you'll see him making comments about duplication.
He had set out to create receivers that others could build, and he
was afraid of people making incautious substitutions.

I'm not completely sure that's the way to go, especially since you
are then doomed to track down the original parts, but that is the
philosophy behind the series.

They were popular precisely for that reason, almost like an
intermediate step between building your own and a Heathkit.

But it sounds like you haven't seen the article, and you already
are making substitutions. That's fine, but if you're going that way
then the original article may not be all that important. Tube
receivers were fairly common back then (though a lot of them had
nothing distinctive about them) and looking through old QSTs or old
books should turn up something.

If you want to use other components (and the original designs were
meant to use specific cariable capacitors and IF transformers) and tubes,
then all you are copying is the conversion scheme. You'd then do
better to get a tube-era ARRL Handbook, find suitable circuits for
the tubes you want to use, and start building. For coil winding,
the same Handbook will provide equations for winding appropriate
coils, based on your variable capacitors and coil forms.

If you're already changing so much, why stay with even that conversion
scheme? You'll have more gain before the real selectivity with that
scheme than if there's a narrow filter after the first mixer, and
certainly the original does not have much selectivity at 1700 KHz.
The reason for the choices were undoubtedly 100KHz to get good
selectivity, without going to a mechanical or crystal filter, and then the
1700 KHz IF selected as being low enough to be out of the HF spectrum, but
high enough so there'd be no problem with the 100KHz image. The 1700KHz
IF is there only as
a stepping stone, and the selectivity only has to kill eht 100KHZ image.

You can probably scrounge up a crystal filter in the HF range for
relatively little at this point, and then make the receiver single
conversion. Or find something somewhat wider, and convert down
to an IF where you can get selectivity with LC circuits, which allows

for multiple bandwidths.

What I'm saying is that the IF frequencies were a reflection of what
was available at the time. There is nothing special about them,
and as long as you are not reproducing an original HBR receiver,
a "classic" tube receiver does not have to have "classic" IF frequencies.

A lot can be said about building an HBR receiver, but if you aren't
actually building it, then there are plenty of other sources to follow.

3938. Can a transformer have too much inductance?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-06 00:00:00 UTC
From: AMDX <AMDX@worldnet.att.net>
Message-ID: <01bf285f$7a8c9160$08874d0c@default>
Source record: 65754

I have a transformer, 950 ohm to 50 ohm
It has a 13 turn pri and a 3 turn sec.
At the lowest freq of use (540khz) the pri reactance is
8,500 ohms. This is much higher than I need but this
is the core I have.
Does extra pri inductance cause any problems?

Thanks
Mike

Hello ,

Thanks for your detailed reply.

I can copy the detailed HBR-8 or 11 as it is
but where is the circuit of this Rx ?
Where can I find it?
Can it be posted on the web somewhere ?
The site in question has everthing "EXCEPT"
the circuit diagram !

Also, substition is a necessity because of impossible to find parts
like the 100Khz Miller Ifts and 1700 Khz IFTs. Both of these will have to
home-made using toroids and trimmer caps.

1/2 of 88mH toroids = 22mH will resonate @ 100 Khz with 100pf
and about 50Khz with 400 pf. They seem like the ideal substitue
for 100 Khz coils.

Also, I dont want use any type of Xtal filter in this receiver, and do it
using IFTS and coils only.

I have looked at several ARRL books, 1957 and 1951 etc
and do see various convertors etc and a dual conversion regen
also with no IF amp in the '57 book. They helped me a lot.
The question of IF coil design still remains , as they still use impossible
to find parts.

The HBR receiver circuit would certaily help me at this point,
as it was close to what Ihave wanted to make myself,
even if I dont clone/copy it , as it is another reference design.

Again, please someone poset a copy of that HBR8/11 circuit.

Hi all,

I just want to thank you all who answered my plea.

Ir seems that I will be able to get something that will work. I haven't decide on the final solution yet, but now I have enough to work from.

Best,

Tomas Ahrne

3942. Need 87.5-108 MHz band pass filter

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-06 00:00:00 UTC
From: Tomas Ahrne <dirac@takethisoutalgonet.se>
Message-ID: <Mb_U3.2847$1C4.28904@news1.online.no>
Source record: 65758

Hi,

Maybe you saw a recent post of mine: "Need very low phase noise XO at 110 MHz". I got so many good answers that I think that that part of my design will work out.

I am designing a digital FM receiver for 87.5-108 MHz. I intend to sample the RF signal directly and do all down conversion and demodulation in a DSP (Digital Signal Processor).

There is also another critical part, the band pass filter.

I was hoping to buy the filter ready made from some manufacturer, but this is not a standard item. I checked how much it would cost to have it custom made and it is quite a bit more than I anticipated. 1-10 would cost $300 a piece from Lorch Microwave. I am checking another supplier as well, but I don't imagine that the price will be that different.

So, does anyone know of a manufacturer who has this filter as a standard item for a reasonable price, < $100, or thereabouts?

The other option I have is to make it myself. Does anyone have any good pointers or references?

The pass band is 87.5-108 MHz, stop bands 78.9 and 113.2 MHz. Ripple in pass band could be 1-2dB, and stop band attebuation preferably 80 dB, or more.

Best,

Tomas

3943. Re: Q: Airport Security and homebrew

Newsgroup: rec.radio.amateur.homebrew

My biggest adventure with airport security occurred when I took a
suitcase of items that somebody in the US missed after leaving Canada
because the specific brands weren't available in the US.

I indicated to the first customs guy that I had some stuff that would
not be coming back to Canada, this made me a candidate for a full
baggage inspection. They shut down all but one of the inspection queues
and all of the customs guys came over to inspect my suit case of
breakfast cereal and peanut butter. They were all splitting a gut
laughing as I headed to my plane.

3944. Re: Can a transformer have too much inductance?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-06 00:00:00 UTC
From: Reg Edwards <G4fgq.Regp@btinternet.com>
Message-ID: <8023oh$8s1$1@neptunium.btinternet.com>
Source record: 65760

You can't have TOO much inductance on a wideband transformer winding insofar as the low frequency end of the band is concerned. For radio work an inductive reactance of 5 times the resistance the transformer works into is usually adequate..

Low frequency problems arise only when there is not enough inductance. The generator then has to provide not only the load current but also a heavy core magnetising current. There may not be much power wasted in the transformer itself but the generator may be very unhappy.

But you can have too much winding resistance. If there's not enough winding area to allow thicker wire then it will be necessary to reduce the number of turns which will also reduce the inductance.

But the principal effect of too much inductance is to limit a transformer's high frequency response. This occurs for two reasons - the leakage inductance is higher and so also is the self-capacitance of the windings.

Stick to the rule of thumb of reactance being 4 or 5 times the terminating resistance and you won't go far wrong. If the high frequency response is then not good enough then there's no alternative with a given core but to compromise.

Or consider using a core material with a higher permeability. This allows greater inductance with fewer turns, lower winding resistance, less leakage inductance and less stray capacitance.

In your present case, Mike, if the high frequency response is OK, leave things as they are.

Hey!

While mobiling around, and working those rare DX stations, I have found it rather frustrating to scramble for paper and pen. I don't have an easy way to install a laptop in the car, either.

So, I thought, "I can use my Palm Pilot" and create a memo. But that was a bit of a pain. What to do?

Create a log program! That's what I did. It is now version 0.1 -- and works ok.

You have a Palm Pilot? Wanna use this logger? Come download the free Application at:

http://hfradio.org/softdown.html#hflog

I have been using it during my jaunts. Helps. It is very simple, and very basic.

Send comments to: hflog AT hfradio DOT org (you can figure out the address)

In other news: The NW ARRL (Northwest Section of the ARRL) website is now hosted at http://hfradio.org/nwarrl/ - and I have been appointed as new Webmaster. If you are in the NW, and have updates, etc., please let me know. If you are interested in the NW Activity, etc., come check it out.

Also, I am still offering free websites for HAM and SWL sites. Want to make your own page? Come and fill out the form.

Don't forget: http://hfradio.org, a non-commercial site offering:

+ Azimuth Map / Equidistant Map Creation (choose any QTH as center, many options

+ Propagational Resources (live, real-time reports, eAlert service (sign up for automatic email solar/geo reports, complete with Aurora index))

+ News, and DX information and reports

+ QSL Manager and Callsign Lookup center

+ Swap and Shop

+ FREE HOME PAGES THAT YOU CAN USE TO POST YOUR OWN HAM OR SWL SITE

+ Bookstore - SWL and Ham related books. Over a 1000 titles so far.

+ Plus more (Directories, etc.)

This is my offering to the community, all funded by me. I am working hard to bring excellent content to the site. I have need for others who might wish to assist. I need a

Software editor -- someone who can review and post software links, etc. Let me know if you are interested. (See the site on how to email me).

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

73!

3949. Re: What is the current state of the art in HF fron end design?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-07 00:00:00 UTC
From: b_runner@hotmail.com
Message-ID: <381e6e37.21327532@news.eisa.net.au>
Source record: 65765

Hi,

Thanks a lot for the schematics. Just a few comments. As it turned
out, I have already tested both circuits before.

The first one is fairly known and it's a good work horse, especially
if one uses a good RF device and pushes a lot of current through. With
small (tiny!) xformers, I was able to get flat response up to 500MHz.

The second one I have never actually built, but I have played with it
with the ARRL Radio Designer. The circuit never seemed to function in
accordance with the original article. In the end, I used blind
optimization to get the transformer ratios. I was able to get
reasonable gain, but the frequency response was never as flat as the
previous circuit. The OIP3 remains to be verified in practice. Anyone?
BTW, thanks Chuck for pointing out the incorrect formula in the
original article. One wonders, if he got such a fundamental thing
wrong... :-) Well it *is* an amazing circuit anyway.

3950. Re: Can a transformer have too much inductance?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-07 00:00:00 UTC
From: AMDX <AMDX@worldnet.att.net>
Message-ID: <01bf28ca$857c8ba0$86b14d0c@default>
Source record: 65766

Well, I don't know if the high frequency response is limited by the
high inductance or the core material. The core is a 4229-3F3
ungapped pot core, the A sub L is about 15,000 (the book says
7,800 + or - 25% but, measuring the impedance of either the pri
or sec gives me 15,033 or 14,675 for A sub L)
I do have high freq losses,
1Mhz----------92.5% of input power delivered to output
2Mhz----------63.5% of input power delivered to output
3Mhz----------45.5% of input power delivered to output
4Mhz----------33.7% of input power delivered to output
5Mhz----------23.7% of input power delivered to output
6Mhz----------17.0% of input power delivered to output
7Mhz----------10.5% of input power delivered to output
This was measured driving the 50 ohm side with .02vpp,
the losses may be less with a smaller signal.
The A sub L of this material drops off about 3Mhz and
the loss curve doesn't show anything above ! Mhz.
The self resonant freq of the 13 turn secondary is above 10Mhz, (to go
above 10Mhz I have to change to a very low power signal generator) it may
be 14Mhz but showed very weak and this is with an additional 15pf of
scope probe capacitance.
Hey Reg, let me give some details :-)
I built this for a Flag antenna,
>http://www.angelfire.com/md/k3ky/page37.html<
the transformer has a shield between the primary and secondary.
I wound 13 turns of #30 wire spaced apart on the
bobbin then put on a thin layer of tape, over this I wound a layer of
brass, being
careful to not let the ends short together. I filled the space with
Styrofoam and
wound the 3 turn primary on the outside of the Styrofoam.
I built a box out of PCB material, by earth grounding the ferrite core
and the
brass shield, I measure 1/10 of 1 pf of capacitance between the primary and

the secondary. This is important to minimize according to the info on the
webpage.
I don't know how accurate this is, I'm using a voltage divider circuit
and when I
substitute a 1pf cap for the transformer the voltage across my resistor
goes up
by a factor of 10----so it seems my transformer has to be much less then
1pf.
I got the antenna working tonight!!! It is supposed to have a cardiod

pattern,
I can confirm this, I live in Florida I aimed the antenna N.E. I am not
hearing
Spanish language stations form the south on this antenna but if I switch to

another antenna they are there.
That's enough for now, I'm going to play with my radio.

Thanks
Mike

3951. Trouble with downconverter

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-07 00:00:00 UTC
From: clifford kelley <cwkelley@inreach.com>
Message-ID: <01bf28d7$5c965920$c543d1d1@bigbear>
Source record: 65767

Hi,

I'm hoping someone familiar with downconverters can answer a question.

I have an L band down converter that seems to have developed a problem. When
I put in a cw test signal instead of a single cw output an additional signal offset by a few hundred kHz also shows up. The desired signal is at 4.3 MHz. Is this indicative of damage to the converter or a loose connection?

Thanks,

Cliff

Need to find a schematic for a Topaz (Square D Co.) uninteruptable power supply PN 84126-01 Ass'y No. 932-00016-01. I have a non working one from garage sale and wish to use it as an inverter to run ham gear. Will pay reasonable cost.

[One or more binary attachments are retained only in the source text.]

My suggestion is that you use a simpler approach first, and if you
succeed with the project, then start thinking about improvements.
I have seen just too many newcomers who specify units which may not be
neccessary or are just too expensive, and often they never complete
most parts of the project

Hi Cliff,

Given the info provided I would suggest to check the local oscillator of the down converter. Some oscillators may show spurious and you get two or more output signals for only one in.

Good luck,

Harke

Go to aade.com (Almost all Digital Electronics). He has a very good filter design program for around $30; this program will synthesize almost any kind of filter you might want to use.

Install an IF Filter? the 870 was the first HF rig to have DSP at the IF.
(translated: it has the finest IF filters available already)

Dear Bubbajoe, you better recheck your facts about the 'only filters' in a TS-870. There are two (2) filters ahead of the DSP filter section that are centered on 8830khz and 455khz. Both are not so good ceramic types, and there is a mod out to replace them with a decent xtal lattice type, which greatly improves things, and then the DSP section works quite a bit nicer.....

There aren't any amateur radio type DSP filters that can work at those freqs (i.e., 8830, 455) at this time...At least not in a cost effective solution that you would be willing to pay. The current DSP in the Kenwood 870 works only at a very low (audio?) level, 'after' all the other filtering. Its like shutting the barn door, after the horse has escaped. Better filters would aid the low level DSP section to better deal with the remaining signals instead of having to deal with all the extra crud..

de Jerry

Dear Jerry,
Yes, you are correct about the filters. I stand corrected. I bought an 870 when they first came out because all previous 'dsp' rigs were at the audio freqs -- and yes, dynamic range impacts from adjacent signals still screw up the rx - or as you say close the barn door a little too late.

the two IF stages are filters -- and obviously had no idea there was a move afoot to improve them -- would be glad to follow up on that.

The thing that brought the 870 out a head of the pack - is that they do the DSP at 40MHz which is still a stage above audio. So you can define your transfer function with digital controls and do not have the 'classic' IF filter controls for SSB, CW ,etc.

It is a very nice radio -- I am sure that as DSP chip processing speeds increase (and get cheaper) the digital will move closer to the RF stage.

OK, Wes, I take it back.

cheers

bubba

Well, I am reading this out of the Kenwood TS-870 service manual. It has four IF's. The first one is at 73.05Mhz, the second is 8.830Khz, the third is 455Khz, while the fourth and last is 11.30Khz. The DSP operates 'only' from the last IF. So as you can see, all those great DSP filters don't do much at all the other IF's that are higher. That 40Mhz clock feeds various things, but that is not in any way the frequency of the DSP unit.

There are some notes on improving the TS-870, which I have not tried (yet), and you may find them of interest at:

http://members.aol.com/ve3bmv/TS870mods.htm

regards Jerry...

This may work with some power supplies but will destroy the pass (output) transistor in others. Usually, the output (+) jack is connected to the emitter of the pass transistor. The voltage regulator circuitry applies a slightly higher voltage (forward biasing the base) to deliver current to the output. When the AC supply voltage goes away, the base voltage can fall to zero because there is no power to the regulator circuitry - but the emitter is still at 13 V due to the battery.

If the pass transistor's base-emitter breakdown voltage rating is higher than 13 V, that's OK. But for some transistors it's only 6 V, and turning off the AC supply with a battery connected to the output can destroy the transistor.

I burned up two power supplies this way before I finally
got smart. Now I always put a diode in series to prevent
reverse current.

Source record: 65787

The simple answer is 'no, but if it has much more than you need, it probably has too much stray shunt capacitance and excessive HF loss'.

You can think of a transformer as being the parallel combination of the following: (1) a shunt inductor (which produces the magnetic field), (2) a shunt resistor (the loss of the ferrite material), (3) a shunt capacitor (the inter-winding capacitance) and a (4) perfect transformer. For efficient operation, you need to feed as much current into the 'perfect transformer'.

(1) The shunt inductor should not 'short out' too much of the current, so the reactance of the inductor should be quite a bit higher than the impedance of the feeder. 5 times has been suggested. This is a function of the mu of the ferrite, the cross-sectional area of the core, the number of turns, etc. For a given core, the shunt inductance is proportional to to the square of the number of turns.

(2) The shunt loss resistance also needs to be quite a bit higher than the impedance of the feeder. This is very dependent on the resistive loss of the core material and also is proportional to the sguare of the number of turns.

(3) The inter-winding capacity. This can be a case of 'it ain't what you do, it's the way that you do it'! Not only do you need to minimise the capacity between the turns of the primary winding, and between the turns of secondary winding, you also need to minimise the capacity between the primary and the secondary! This is a work of art!!! The usual technique is to use bifilar (ie 'two-wire') or trifilar (three-wire) winding techniques, where the primary and secondary windings are laid down on the core in a precise, orderly manner, so that they are interwound. Ideally, the relationship of the windings form a transmission line where the characteristic impedance is the same as the feeder, while, at the same time, the capacitive coupling between primary and secondary is as small as possible.

(4) This is simply the turns ratio required to transform the load (on the output side of the transformer) to that required by the source (on the input side of the transformer).

Some RF transformers can have a very wide operational bandwidth. For example, some cable TV splitters and taps efficiently cover 5 to 1000MHz with an essentially flat frequency response and minimal signal loss (say, 1/2dB). However, these are VERY low power devices. Higher power transformers usually cover a smaller bandwidth (eg 2 to 30MHz).

I think that the simple 'rule-of-thumb' way of designing a wideband RF transformer is:
(a) Use the highest mu ferrite possible consistant with low shunt resistance loss (ususally, a high mu tends to indicate a higher loss).
(b) Use the minimum number of turns, consistant with obtaining sufficient shunt inductance for the LF end, and a sufficiently high shunt resistance.
(c) Find out how to wind the transformer in a way that shunt and interwinding capacities are minimised!
(d) Find out how to compensate (to some extent) for the effects of the residual shunt and interwinding capacities.

Ther are other things to consider, such as saturation (non-linearity of the mu of the ferrite) etc. However, these are much too complicated for the present discussion!

So there you have it (for whatever it's worth).

Ian.

Hello guys ,

Is there anybody who has phone number of distibuter who carries
vacuum variable capacitor in USA or Japan ?

I need VVC 1500pF , 5KV now. I'm planning to buy 5 or more.
If dealer looks at this e-mail , please give me a quotation.
Fax : 82-2-3426-6895
Phone : 82-2-3426-6896

FOR SALE:

BOX OF QTY 9 New & used CERAMIC TUBE SOCKETS of various types.
Including:
QTY 3 New 7-pin sockets (6 small, one large)2.4" square
QTY 2 7-pin sockets (6 small, one large) 2.4" square, 2.4" square, used.
QTY 1 New Oval 7 pin socket (2 larger, 5 medium diameter pins) like 1625 uses.
QTY 1 Oval 7 pin socket (2 larger, 5 medium diameter pins) for 1625, used.
QTY 1 Square 7-pin socket (2 larger, 5 medium diameter pins) 2.6" square, used.
QTY 1 round 11-pin socket with octal style pin in center, used.

Will sell these only as a complete lot: $22.00 plus shipping

>reverse current.

Yeah, that's the standard way to protect the supply. It degrades the output regulation a little bit, which slows down recharge a little bit, but it doesn't matter for this application.

I have a lead-acid battery charger that uses a special IC to control the charging process, and it takes an interesting approach to this problem. It puts a diode between the pass transistor and battery output to protect the pass transistor, as described. But the sensing point for the error amplifier, which controls the voltage during the constant-voltage part of the charge, is directly at the battery output, "downstream" from the diode. Thus the diode is *inside* the feedback loop, and the voltage drop across the diode that changes with current has no effect on output voltage.

This leaves the error amplifier connected to the battery, unprotected by the diode. But its circuitry is designed to handle battery voltage applied to this point when no input power is present, so there is no damage. It also draws only 50 ua or so, so it won't discharge your battery any significant amount if the charger power fails.

Dave

I used to travel quite a bit on business but never found
much electronics in the Atlanta area...

Another source I should mention is discarded consumer
electronics. By their very nature, radios and TVs contain
RF components. VCRs are particularly good. Go for a walk
around the neighbourhood before the garbage truck comes...

As an example of putting sources together, I built a simple
amplifier over the weekend for my computer's soundcard to
drive a couple of speakers. Highlights:

LM384 amplifier chips: minimum-order padding
Speakers: potluck at the surplus store
2.7 ohm resistors, a favourite of the LM380/384/386
datasheet: ditto. I bought a dozen.
10k trimmer pots: salvaged from a dead VCR
Other passive components: stock

I tested the amplifier and speakers with a variety of noises,
all the way from weather satellite APT recordings to Wendy
Carlos MIDI files. It worked perfectly...

My bench power supply is built along similar principles,
with a surplus transformer and bridge rectifier and a heat-
sink from a hamfest. I splurged and bought a fancy 5 amp
regulator chip (LT1084) and some fresh new filter capacitors
from Digi-Key.

3977. I don't understand filters.

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-08 00:00:00 UTC
From: David Snyder Hale <david@isi9.mtwilson.edu>
Message-ID: <806mo6$5j8$1@agate.berkeley.edu>
Source record: 65793

Hi,

Could someone help me understand a filter design? Not the design per se, I guess, but the response curve. In the 1996 Handbook there is a broadcast band filter which states that it rejects bc-band stations and passes 1.8 to 30 MHz. But then it shows this insertion loss curve with sort-of 3 peaks at f2,f4,f6 which are given as 0.677, 1.293, 1.111 MHz. So, it doesn't seem to me to correspond to the HF bands, but there must be some sort of frequency normalization that I don't understand.

If someone is interested but doesn't have the 96 Handbook, I put a GIF of the filter response curve available via anonymous FTP at isi8.mtwilson.edu

As I recall the filter, the plot is upside down compared to what one normally sees. The filter is a BCB reject filter that passes 1.8 MHz up- so the insertion loss is near zero from 1.8 MHz and higher. There are 3 (or 4 don't recall) zeroes in the reponse scattered across the broadcast band and I think one at zero freq.

Yes, I get that impression. It plots insertion loss vs. frequency and
shows zero insertion loss above 1.8 MHz. But the plot runs from 0 to 1.8
MHz, indicating high insertion loss below 1.8 MHz. That is what I don't
understand, how that makes it a low pass filter.

Dave,
I quckly glanced over the article- I did not see where it says it is a LPF. This is an elliptic high pass filter.

But it's a high pass filter. It's meant to reject the broadcast band,
where strong local signals reside, and pass the HF range.

The plot is upsdie down, since normally you'd see zero insertion at
the top of the plot, and then attenuation below.

I would assume the plot ignores above 1.8MHz because, it's relatively
flat, or at least minor ripple and unimportant. In fact, the text
says "less than 1dB insertion loss above 1.8MHz". The plot leaves off
at 1.8MHz and zero insertion loss.

The filter has ripple in the area where it's purpose exists. Thus
the ripple might be of use to the builder. If a local radio station
happens to be where one of those ripples hits minimum attenuation,
in some weird case it might not be enough attenuation. So it probably
is useful information.

You can tell it's a high pass filter because the capacitors are in
series with the signal (attenuation increases as frequency goes down)
and the coils go from those capacitors to ground (thus in effect
shorting more signal to ground the lower the frequency). Actually,
it looks like the coils act as series tuned resonant circuits, they
create a notch, so they may help to attenuate the frequencies below
the cut-off frequency more rapidly.

Running the LC information into equations might show this. And it mentions
that the filter originally in QST for February 1978, and that might
give a more complete explanation.

I'm not quite sure what the original question is? Is it merely confusion because the plot is upside down from the way you'd commonly see a plot, or is there some other question?

Exactly what is needed if you have a long antenna wire for the 160m
band and there are several local powerful medium-wave broadcast
stations which force their way into the front-end of your HF receiver.

Thanks for all the replies. Yes, I see now that it's a high pass, but now I'm really confused as to how it's effective at eliminating commercial stations like it says, since these stations would be at a higher frequency than the HF band.

Ok, now for the "why" I'm interested. I live near an antenna farm which services TV/radio to the Los Angeles basin. There is over 20,000 kW ERP about a mile from my shack. I'm trying to eliminate the S3 to S9 white noise level in my HF xcvr. There is a link to this RFI problem on the web page below for anyone interested. Thanks and 73,

The commercial stations that it is filtering out are those on the Medium Wave
(aka AM Broadcast) band - not VHF/UHF radio and television stations. The
MW band runs from (approx) 550 to 1600 kc/s - i.e. just below top band.

Also keep in mind that computer clock crystals are generally specified
to have a frequency accuracy of 50 or 100 PPM - not very good. For
a radio transmitter, you usually need an accuracy of 5 or 10 PPM
after adjustment. Computer clock oscillators are not adjustable.

However, I have found a cheap source of good quality oscillators:
cell phones. Old analog cell phones can be found for $10 or less
at garage sales and flea markets. They all seem to contain a
temperature-compensated crystal oscillator which is adjustable.
These are probably already within a few PPM and can be adjusted
to less than 1 PPM error at room temperature, and will maintain
frequency much better over temperature change than the uncompensated
crystal used in most ham gear.

These TCXOs would make excellent reference oscillators for a radio using
a PLL for tuning. The analog cellphone frequencies are spaced 30 kHz
apart, so the oscillator is always a multiple of 30 kHz - typically
something like 12 MHz (400 * 30 kHz) or 15.36 MHz (512 * 30 kHz).
With a bit more division, you could have tuning step sizes of 10 or 5 kHz.

Dave

Source record: 65808

I've been looking at building a UHF transmitter and a receiver for it, but i don't know how much power i need to trasmit with. Does anyone have the math to show how far 1 Watt can transmit in the open (line of sight), and what is a dbm? and how would I raise/lower the output?

3993. Re: I don't understand filters.

Would a 5-Branch elliptic low pass filter with fc=30MHz do the trick for cutting out the 16MW of TV & FM radio RF? (eg. page 30.30 in '96 Handbook)

Or would the harmonics still get through? I assume that's what I'm experiencing now, is lower order harmonics.

Can I transmit through such a filter as well?

Source record: 65812

A dbm is power level referenced to 1 milliwat, so 0 dbm is 1 milliwatt. It doubles everytime you add 3dbm. 3 dbm is 2 mw, 6 dbm is 4 mw, 9 dbm is 8 mw, 30 dbm is 1.024 watts, 33 dbm is 2.048 watts, 50 dbm is 104.8 watts and so on.

A radio transmits infinitely far. The important thing is how far away you can receive and demodulate it. 5 factors control this - the transmitter power, the transmitter antenna system gain, the path loss between the transmitter and receiver antennas, the receiver antenna system gain and the receiver sensitivity. As long as the transmitter power, plus the antenna gains minus the path loss are greater than or equal to the receiver sensitivity, you'll be able to hear the signal and demoudulate it. The math is:

P = transmit power in dbm
Gt = transmit antenna system gain in dbi
Gr = receive antenna system gain in dbi
L = free space loss in dB

dbi is antenna gain referenced to an isotropic antenna (that's one that radiates equally in all directions). For example, a dipole has a a gain of 2.14 dbi, a groundplane antenna has 3 dbi and a good yagi can be 13 dbi or higher. Just as with dbm, every time you add three, you're doubling the gain. So the 3 dbi groundplane has double the gain of an isotropic antenna. When you use the antenna system gain, that includes the feed line losses, polarization losses, etc. Power calculations are done in decibels, dbi and dbm because then you can just add and subtract the power levels and gains and losses instead of having to multiply and divide.

Free space loss can be approximated by :

L = 32.4 + 20 log f + 20 log p

where f is the frequency in MHz and p is the distance in km

So putting all this together, if you have a 1.024 watt (30 dbm) 144 MHz transmitter feeding a 13 dbi yagi aimed at a second 13 dbi yagi 10 km (or 6 miles) away, the available power from the receiver antenna into the receiver is:

P = 30 dbm
Gt = 13 dbi
Gr = 13 dbi
L = 32.4 + 20 log 144 + 20 log 10 = 95.57 dB

30 dbm + 13 db - 95.57 dB + 13 db = -39.6 dbm or .107 microwatts
From Ohm's law this is about 46 microamps or 2.3 millivolts in a 50 ohm load

For FM you typically need a 20 dB signal to noise ratio for no interference. This means that the received signal must be 20 dB above (about 100 times stronger than) the noise in the receiver. So in this case, as long as your receiver noise is less than -59.6 dB (or 23 microvolts), you'll hear a clear signal. Just for reference, my ICOM-u2AT lists a sensitivity of 2 micro volts for 20 dB SNR, so this signal would be about 1000 times louder than the minimum for clear FM reception. So I could cut the transmit power by 1000 down to 1 milliwatt.

Note that if the power budget wasn't enough to get through, I could have raised the power :-(, improved the transmit antenna :-), improved the receive antenna :-) or the receiver sensitivity :-). Sometimes you can even improve the path loss, for example, raising the antenna above the trees.

As a practical example, I once received a full-quieting signal on a hand-held with a rubber ducky from a 35 mw satellite beacon over 200 miles away.

For a really excellent discussion of radio link budgets, see Chapter 13 of The Satellite Experimenter's Handbook by Martin Davidoff, K2UBC (published by ARRL).

Well, thats not quite correct. It has two (2) I.F. filters at 8.830Mhz and
455Khz ahead of the DSP filter (11.xxKhz) section. They are lousy filters, thus
the interest in improving them...

Minor correction: +30 dBm is exactly one Watt.
Doubling the power increases the reading by slightly more than 3 decibels,
actually close to 3.010299 dB. It's 10 times the log (base 10) of 2.

I'm thinking low noise and low distortion. As you say, high speed isn't
a big selection parameter. Thank goodness, low noise, low distortion amps
aren't expensive any more (unless you stick "ultra" in liberally).

> noise is 5 nanovolts/rtHz, then the output noise from the amplifier is roughly
> 300 nanovolts in the 3kHz bandwidth, or more than 140dB below full output.

Still in all, the "minimum detectable signal" is minimally detectable for
a reason, and I suspect the noise on that 11 uV signal out of the detector
(I'm ignoring the 1 dB loss specified) will be pretty close to another
11 uV.

Now to raise 22 uV to a milliwatt in an 8-ohm speaker, figure a voltage
gain of 4000 or about 70 dB.

Now apply that 70 dB to the 4V mixer output... how far does the cone fly?
:-) *That* is why I want some AGC. More practically, though, allow an
input of 1 mV from the guy with the nice signal, and we're jumping from
one mW to 2W at the speaker, a rather uncomfortable change in volume.
As clunky as AGC can get, I'd rather accommodate the change than clip it
and ride a pot.

What does your "memory" consist of? I never thought of a parallel port as
all that fast, i.e. 200 to 400 KHz when it's really flying.

How fast is the information coming out? Can you give a rate?

Well, you can pobably pick up a commercial high-power LP filter made
to filter out spurious emissions from your tx to affect BC and TV sets
nerby. This filter would just as well filter out signals trying to get
into your radio!! It should have some 80-100 dB of attenuation at 100
MHz.

Good Luck

Rick,

ALLRIGHT!!

What time of day do you think you'll be on the air? I just moved to a new QTH, antenna is up, and will try to listen for you.

A note about RF power output:

Many RF power meters are not as accurate as we assume them to be. They are often taken too literally.

For example, I know a ham with a popular RF power meter who could get "only" 600 watts out of his Heath linear, even when running 1200 watts input. The meter specs, however, said "plus-or-minus 10% of full scale" and he was using it on the 2000 watt scale. So it could be off as much as 200 watts!

Once you get the hang of rigs like the one you built, tuneup will be a snap. 35 watts can make a lot of noise on the bands!

Good luck with the rig - let us know how it works out for you.

OK, I have some 4 pin oscillators and some 6 pin oscilators. does
this make a difference?

How does one tell the difference. Many don't have part numbers that I
can see or interpret.

I've been pulling off crystals and oscilators off of all of my junk
boards for the past year. I have a nice small collection.

Does anyone have a nice simple design for a 28.328 cw tranceiver or
transmitter.

Source record: 65650
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design,sci.electronics.misc

The problem with Litz at HF is not stray capacitance between wires or stranding irreglarities. I doubt if Terman ever said so. For Litz to behave as intended each individual copper strand should have a diameter something less than the skin depth in copper.

Skin depth in copper = 0.0026 / Sqrt(F) inches where F is in MHz.

This is fine up to a few hundred KHz.

But at HF, to manufacture (draw through diamond dies and then insulate with enamel) such fine wire is extremely expensive and, to be of any use above a few MHz, ultimately impossible.

However, above a few MHz, high values of Q can be obtained with solid copper wire. Incidentally, no significant reduction in resistance is achieved by silver plating. It is not worth the cost of a plating operation and of the silver itself.

If by "name equivalents" you mean the same chip under different part numbers in the USA and in Europe (not forgetting Japan) then you'll mostly be disappointed.

Generally you have to look for *functional* equivalents - devices that have very similar properties and can be interchanged in non-critical applications.

Perhaps it is the one which goes with the texscan sweeper? I believe
it is good up to 500MHz. I bought the 75 ohm version because it was
available - and the most important is that it can be repaired, and it
has only minor faults for measurements on VHF range

What does "10,000 ohms, P-toP" or "plate to plate" mean?

What is the significance of this "p-to-p" impedance (or resistance) value, when working with interstage or audio transformers?

Does this value have something to do with the resistance of the windings themselves, or does it somehow figure into the impedance matching ratio (primary to secondary)?

Any help on this would be appreciated. Please reply to my e-mail.

Thanks!
J.

Yes the pager watches are real. However they use a zinc air battery
(hearing aide battery), there is no way to recharge it, and the life is
short. (1 or 2 months typical).

Also they are twice the price of the digital cell phone I just bought,
which has messaging,voice mail, etc.
Just my opinion for what it's worth.

For your filter, check ``Microwave Filter Co.`` They have a number of FM Band filters .
Analog Devices have interesting IC`s with low noise figure and AGC. You may need to cascade 2 AGC stages. What about your AGC generator, is it going to be done from
your DSP processing?

No offense to Mr. Dahl, I'm sure he builds an excellent product. As any of you know, HV transformers are getting like hens teeth to find. Even Fair Radio Sales has only a small selection any more.

Other than cannibalizing old transformers, does any one know of a source for "E" and "I" pieces for the core of a transformer? I would like to try my hand at winding transformers. I did it as a teenager and got pretty good at it.

Many thanks in advance.

At first I thought you meant the 32768kHz watch crystals (also used in some clocks)...but I guess you mean the inexpensive crystals sold for microprocessor, etc., clocks. Yes, if it's just a crystal, you can put it in an oscillator circuit just like other crystals, and pull it. I do that in a design I'm doing at work, for example. You might be able to pull your 50MHz xtal up safely into the 6-meter band, but since the tolerance isn't very tight, be sure you have a way to check to make sure you really are in-band. On the other hand, if it's a full clock oscillator, unless it's one of the fancier ones with an adjustment, then you can't pull it. I've salvaged a few adjustable ones from boards, but they are much rarer than the non-adjustable oscillators.

Cheers,
Tom

I have wound loads of them. I find that some of the cheaper mains "auto transformers" of the kind that transform 115v to 230v or 230v to 115v are dirt cheap. The sort I usually get are about US$6, made in Spain. Undo the two bolts and the whole lot almost falls apart.

there's hardly any wire on the things, so you can strip it down in a few minutes and have a perfect plastic bobbin to fit the E and I laminations. Just two small words of warning:

1. Don't consider re-using the wire or using it as a ready-wound primary. The last few I bought in Saudi did not even use copper wire!!
2. Lightly varnish one side of the laminations with a decent spray varnish. They are usually lousy insulators and the txfmr tends to run hot if you don't.

The transformers I make all run stone-cold. if you want to see a 50-watt transformer in a project then i have one on the web. Take a look at http://sm0vpo.8m.com/tx/2tubetx.htm the third picture down the page. Sorry the picture quality is so lousy, but - a) it does the job - b) its free.

> Mike N2JVT
>

The complete answer is:
We can get conversions by the sum or difference between LO and RF
frequencies.
In the SSB case, for sum frequencies, no matter which input frequency is
higher, no inversion occurs.
For difference frequencies, if LO>RF, an inversion occurs; if LO<RF no
inversion will occur.

Thanks Bob for the correction. (I even used to know that once.) It's good to know that someone actually reads these things. And it's a great relief to see that even with all the fast typing it was only 0.3% off. Usually I end up losing several decimal places :-)

Does your memory actually pay attention to the clocking bits or are you just reading the parallel port as fast as you can with another computer?

If you're paying attention to the clocking bits, then you've got a bug in your circuit. Probably wouldn't hurt to go over the timing diagrams again.

If you're reading the parallel port, you can try:

1. Using a faster computer to run the memory program

2. Speed up the memory program by running a DOS/assembly language version if you're not already doing so.

3. Use a slower computer to run the National software. Everybody's got a 33 MHz 386 in their attic, right?

4. Run the National software in a DOS box under Windows if it's a DOS program.

5. Run a bunch of other programs at the same time if you're already doing 4. This is especially good if the host computer has 2 LPT ports and you run a long print job on the port that isn't programming the PLL.

6. Run the National software in a debugger and single-step. Have an enormous pot of coffee there to keep you awake.

7. Change to a circuit that will pay attention to the clocking bits and store the values. This is really easy to implement with something like the Atmel AVR family of 8-bit microprocessors. The 8515 in particular actually has a 3-wire SPI interface for capturing the data, 512 bytes of SRAM for holding it and a UART for playing it back to your computer's serial port all on 1 chip.

All of these are just kludges. The real issue is what are you trying to accomplish. If you are just trying to figure out how to program the device, the answer is in the data sheets. Even though they can be confusing, it'll probably be faster to re-read them many times and to post questions about them than to get the memory setup working.

One source of cores that may be good subjects for winding are industrial isolation transformers.

They come in various KVA ratings - starting around 1 KVA and going up. They are complete with both primary and secondary wings and may be 1 to 1 or 2 to 1 or higher. You may find them at a dealer that handles industrial surplus.

They have an advantage in that you know they can handle the power and they already have the primary (you have to make sure that the secondary is on the outside) so there's less work to get the final output voltage you want.

I believe that the 10k ohms refers to the load impedance the tubes will see in the signal frequency range if the secondary of the transformer is loaded with its specified impedance. The transformer winding will look almost like a short circuit at DC. Once the bias point of the tube circuit is figured out, imagine that the DC is being supplied to the tubes through a hign impedance choke, but a 10k resistance couples the two plates together at signal frequency. This allows you to calculate what the plate voltage will do as the plate current varies (calculate a load line).

The Fairchild FST3125 bus switch makes a very good mixer device, by all
accounts. I've just bought some, and will be trying them out when I've
made a PCB. G3SBI's experiments with them have been reported in RadCom.

The plate to plate impedance is the impedance seen by the plates of the tubes when the secondary is loaded with the rated impedance (resistance).

The transformer is intended to be driven in push pull from a pair of tubes.

Hi Bill,

Thanks for the congrats. It was an uphill climb but it was worth it. Yep, I got the MMRX working after a lot of tial and error, but only on 80m. I think that my coils are not quite right on 40m since I can't really find anything to listen to except static. The filter works pretty well but it's a bit too sharp, if I'm not carefull I can tune right past something without know it. I'm using the ceramic oscillators that I told you about. I tried wireing the 455KHz cans in like you suggested but they didn't work. I think I must have missunderstood your directions.

The biggest probelms seems to have been wireing errors since I found a lot of bad solder joints. My power problem took the longest to figure out though. The transformer that I was using was only giving me 50 volts instead of the 100+ that I needed. It was a 120in/120out 45ma job but I was seeing only 50 volts of DC. I thought that I was tring to pull more current than the transformer was capable of giving me and after hooking in an amp meter I saw that I was indeed pulling the full 45ma . I spent a week waiting for a new transformer but before I got it I got to thinking about the spec and the spec stated that you only needed a 45ma transformer so I fired up the rig with my amp meter in place and started tracing wires from the power in. I'd turn off the rig, disconnect a wire that was connected to the power input, turn on the rig and read the meter. Eventually I found a wire that when disconnected caused my amp reading to go to about 20ma. I traced that leg till I found a solder joint that was ever so slightly brushing up against a ground post. You could not tell that it was that close to the post unless you looked at it from just the right angle. Anyway I wrapped the joint (should have done that in the first place) with electrical tape fired up the unit and "walla", no more current drain.

I had to go through a lot more to finaly get it up and running but I finaly did it. I'd like to write up an article like the one you've got posted on your site but I don't think I can get around to it till after the holidays. Anyway, thanks for the help! I appreciate the support.

TNX!

It's interesting how you pass by an expression and never wonder about
it's meaning. I sure never thought about "plate to plate" until this
post.

A quarter century ago, I bought a Radio Shack "Dictionary of Electronics".
I'm not sure I would have bought it at full price, but I was at a hamfest
and some guy was selling them (I guess the previous edition) for a dollar.
I've never used it much, but when I do refer to it, I am always surprised
at being able to find a description.

It says: "Plate to Plate Impedance: The load impedance between the two
plates in a push-pull amplifier stage".

Hello all, Bob here. I am in N/West UK.
I have just (last night) Bought at a silent key sale,
a 2 tube wireless, kit of parts.

It is for a two tube set, its complete...
Apart from the building /assembly instructions.
It has a list of parts, and the list is complete.
I want to build this kit, as I have been wanting
to 'get into' Tube / Valves for ages.

Have any of you, a schematic,
for a 2 tube AM /MW receiver.

Or possibly ? If I tell you of the components,
could you point me in the right directions.

It was made by E.M.I Institutes in 1955

The main bits are, as follows.--------

The 2 tubes.
1, is a Marconi. N 17 / 3S4
2, is a Marconi. W17 / DF91
It says, or equivalent, but I have the stated tubes.

It has 6 Resisters, 2 x 47 K, 2 x 2.2 M,
1 x 100 K, 1 x 680, all 10%.
1x 1/2 meg volume control

It has, 6 waxy / looks like ceramic type,
1/2 in square Caps, 3 x 100 pfd. 1 x 500 pfd.
1 x .01 mfd. 1 x .1mfd.
And 1x 25 mfd 25 V Elec. cap.
And 1 x 500 pfd Variable.

1x Double range coil.

Has anyone of you a schematic,
that fits these components ?
I know the variable is for the tuning.
I have built transistor radios, RX and TX,
I have U.K. Novice licence.
I have had NO experience, with Tubes, in any way.
Can you recommend a book, about the very basics of such ?
Thanks Bob

I would try to find an old tube manual that shows you the
elements of the two tubes, and their pin numbers. Then you can
look at the assembly drawings, and create your own schematic.
This exercise will give you great familiarity with your kit.
If you don't know the difference between a cathode, grid, and plate,
you may want to visit your library and see if they have old books.
Older Radio Amateur Handbooks are also excellent resources.
Good luck.

web site is: www.mitsubishi-chips.com

However, that device is not listed under PLL synthesizers nor does it come up in a product search.

Unfortunately, Mitsubishi has offered very little documentation in North American over the years for their analog ICs. I've never seen a databook for this area. The primary reference document is their ASSP selection guide which is basically a list of devices and single page specs.

Like many Japanese semiconductor manufacturers, they offer a wide range of products which are marketed and sold almost exclusively in Asia for use in consumer products. It is very difficult to find specs or buy such devices outside of that region.

Thanks! My controler with memory is designed to be used to program the National
PLL
LMX1501. It is made of a PIC16C57 and an Atmel Eprom 93C66. The controler is
used to switch the PLL to different frequencies; in fact it does the same work
as the computer but its purpose is to free the computer. Somebody mentioned me
that old computers with a "TURBO" button would do the job, but my pentium high
speed computer does not have such a button. Somebody else told me that it is
possible to program my computer to operate at slower speed, but I do not know
how to do it.
Regards! Yvon

4064. Re: Very basic transformer question -- ??

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-11 00:00:00 UTC
From: MC 10kW Jesus <bogus@thisdomain.org>
Message-ID: <382A18A1.9CC57EF7@thisdomain.org>
Source record: 65680
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.basics

The 10k P-P means that this is an output audio transformer intended to be used in a push-pull circuit where the tubes, ideally, like to see a 10k impedance from the plate, or anode, of one to the other. I know it's only a single pair of tubes because if it were more the p-p impedance would be much lower. Push-pull tube amplifiers will produce maximum output when the the load they are "looking into" is optimum. Much the same as RF amplifying circuits work best when driving, or being driven by, the optimum impedance.

The transformer itself has no impedance and the secondary winding must be terminated in its design impedance to reflect the 10k p-p impedance back to the tubes. In a tube audio amplifier this is typicall 4, 8 or 16 Ohms.

Some tube output transformers are VERY valuable now. This is particularly true of Peerless, Acrosound, McIntosh and Dynaco units. For instance, a pair of A470 outputs from a Dynaco ST70 are worth an easy $150. However, if they are Bogen they aren't worth a fiddler's.

Much more about impedances and tube amplifiers if you are interested......:->

4065. Re: IC706mk2 transmission problem

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-11 00:00:00 UTC
From: Murray Kelly <mkelly@powerup.com.au>
Message-ID: <382A1A5D.63C2@powerup.com.au>
Source record: 65681

My 706Mk2 won't work into anything but an almost exact 1:1 match.

This is annoying, as I need 2 tuners - one into the FL2100Z and
another for the antenna itself! Naturally I don't bother with
the linear as a result.

The 706 'remembers' one non-amateur band in each of the HF/VHF
groups (ie if you were last listening to WWV on 15MHz it will
put that in the HF group for next time) and if you tune to the
local FM station it will 'remember' that, too, in the VHF
positionas well as the 2m setting last used.

Hope this helps.

I have a 3 element yagi that when the director is pointed upward you can adjust the swr..when the antenna is placed in the horizonal postion the SWR gos up and cannot be adjusted...any help would be appreciated..thanks in advance.

4067. Source for power comp. resistors?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-11 00:00:00 UTC
From: David Snyder Hale <david@isi9.mtwilson.edu>
Message-ID: <80d8j4pje1@agate.berkeley.edu>
Source record: 65683
Cross-posted to: sci.electronics.components,rec.radio.amateur.homebrew

Hi,

Does anyone know a source for inexpensive power composition resistors? I would like to build a 50 ohm, 100-200W dummy load for RF (1.8 - 30Mhz at least, up to 500 MHz in a perfect world).

I tried buying a couple of "non-inductive" 100W resistors from C&H Surplus, but they really weren't non-inductive enough, as they gave SWR>3 at 28MHz.

MFJ Enterprises sells a 300W 50 ohm dummy load for $35, so the resistors would have to add up to be less than that, obviously. It seems the problem with all of the high power resistors is that they are wire wound or spiral etched. And to buy enough 2W carbon comp's at $1 ea would be ridiculus.

4068. Duplexer

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-11 00:00:00 UTC
From: Peter <anonymous@cotse.com>
Message-ID: <199911110811.DAA04782@cotse.com>
Source record: 65684

Hi,
I wonder how important is it to tune the duplexer in a repeater system. I have a repeater up and running on a new freq. (within the duplexer range) almost every week without retuning it; it seems to worked just fine.

I have use this repeater system for about six months on many different frequencies because it served a backup unit while the regular repeater is on the shop.

The duplexer is Celwave; Cat.No.633-6A-2; Range:450-470Mhz.

If it is really important to retune the duplexer every time I change the freq., would someone tell me how to retune this particular duplexer. Thank you.

If you're using a PIC, then I'm really puzzled. It should be able to easily keep up with the parallel port. What clock frequency are you using? Just as a comparison, I have no trouble with a 4 MHz Atmel AVR processor. Are you running native assembly code or going through an interpreter? Or are you slowing things down to be able to access the 93C66? If it's the last, maybe you should consider an external SRAM cache for the capture function. Or another chip with with more on-board fast RAM. Good luck,

73 de KF4PV/3, Laszlo

4075. Re: Homebrew Tube Tester

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-11 00:00:00 UTC
From: JW <jdwalton@home.com>
Message-ID: <382AF32A.D7639154@home.com>
Source record: 65691

You can test for mu, gm and Rp in situ - see any RCA tube manual for the definition of terms. You will need to fashion a jig from a socket and plug in order to change the grid voltage and measure the change in plate current (dV over R).

I have found that one of the problems with tube testing - at least for the Hallicrafters stuff I have, is that an RF or IF amp tube may test OK, but just not work right. It is less frustrating to just throw in a new 6BE6, 6EA8.

I do have plans for a microcontroller tube tester on the drawing board - using a PIC 16C710 - the project is temporarily stalled (because I've been playing with a new Atmel processor). There seems to be some modest interest on the "rec.audio.tubes" newsgroup, but it appears that folks are contented to buy a used Hickok or BK tester for $150 rather than plug a $20 microprocessor device into the parallel port of their computer. Go figure.

You didn't say what frequency you are working with. But if the SWR is high when the antenna is in a horizontal position, check for conductive masses near the antenna. What method of adjustment are you using?

If you have a gamma match, T match, balun, coaxial or open feeders, it all matters. Give us the details and we can help. How are you measuring SWR?

Well,,, one of the DIY welders is using rewound microwave transformers.
Cheep, at the appliance repair shop, and usually have the hivoltage
windings toasted. Also good for a kw for several minutes.

I know others have replied to this but may I also suggest this; not having seen it.
I agree the 10 00 ohms plate to plate is the load impedance that the plates of two tubes operated in push-pull will 'see' reflected back when the secondary of the transformer is terminated (ie. feeding into) in its correct impedance.
Taking a flyer on this;
1) Lets first assume the transformer is designed for use as the output transformer of an audio amp with two pentode output tubes operating in say Class A push-pull. (for example; I notice from a tube manual of the 1960s that two 6F6 pentode (audio) output tubes have a listed "plate load" of 10 000 ohms). The secondary would be terminated by the appropriate 8 ohm or 4 ohm speaker or speakers; there might even be 'taps' to accommodate different combinations of speakers. IMO the transformer may very well be an out put transformer of this type.
2) However push-pull could also be used in the interstages of big tube amps. or in the driving stages of audio/music modulators for AM (Amplitude Modulated) transmitters. In that case the primary plate to plate is as above; the secondary, in interstage work would be designed to match the impedance, typically, of the grid input to the next (or final) stage of the modulator. So, for example, there could be a pair of 6F6 in push-pull driving a pair of 807 in push-pull which in turn would modulate the transmitter:
3) AM modulation was often through a large 'Plate Modulation' transformer. So there is also a possibilty that your transformer could be a modulation transformer. Often size and markings provide clues to its original purpose.
You could check the ratio of the transformer by applying a low AC voltage to the p-p winding of say around 20 to volts; if you then measure about one (1)

volt or less on the secondary, the ratio of your transformer is around the 35:1 range as follows for Number 1 above.
1) Audio output?
10000 divided by 8 = 1250 this is the ratio of the 'impedances' (resistances).
The square root of 1250 = 35
35 is the 'voltage' ratio.
Therefore 20 volts divided by 35 = approx 0.6 volts. (or around there somewhere.)

2) If you get an entirely different and higher voltage then the transformer may be an interstage designed to feed into the grids of the next tube stage; as per number 2 above.

3) If the voltage is in the same range or say around half of the 20 volts then start thinking about number 3.

Hope this helps. And, there are people out there who are more expert; so ask again if necessary.

All the best. Terry S.

Tom -

I took 20 18,000 ohm 5 watt carbon resistors and paralleled them between two pieces of perf board for spacing, placed them in a tupperware type container for waterproofing. It worked out great. I made two of them to terminate a 20 meter sloping inverted 'V" with 100' legs (7dBd gain wire antenna).

Are there any problems using ferrite cores for power transformers? Amidon lists a number of E cores and bobbins. Come to think of it, I put a few projects on hold cuz I couldn't find a large enough transformer for the power supply. Never thought to wind my own, even though I recall now watching my father painstakingly stack little iron pieces...

Take look in any ARRL handbook for pin-outs and practical applications.

You can also use the DC - 500Mhz port normally used as IF out as RF in and 5 - 500 MHz port as IF out, if you are using 9MHz IF or above.

Hi

If you disconnect the load from the secondary, you can get the
equivalent load by connecting 10 K between the plates. Thats equivalent
to 5 K from each plate to the centre tap. 10K is a very common plate to
plate load for push pull tube amplifiers.

Roger

> Does anybody know if a method exist to slow this information. Any
> information is appreciated. Thanks!

Is the problem that the software is ignoring handshaking on the parallel port? If it is, then this won't help.

But if it sends data to the parallel port, then a strobe signal, and waits for the busy or acknowledge signal (it's too late for me to track down which is which), then I would think the problem can be fixed with a bit f hardware.

I've heard of some cases where the strobe signal from the parallel port is too short, though I think that is rare. A fix would simply be lengthening the pulse with a one-shot.

If the data is not there long enough, then it's a matter of not acknowledging until enough time has occurred. Maybe just a delay of the acknowledgement bit. Or if the data bits are not available long enough for the memory, an extra latch might be needed.

As it is, perhaps it's just a case of your added hardware nt doing anything with the acknowledgement pin (or is it the busy pin?)? If it's just tied high or low, or ignored, at the moment, starting to use it could solve the problem.

But as I said, none of this will help if the specific software doesn't wait for feedback from the parallel port before sending another byte out.

OK,

My ham shack is on the second floor of my house.
I really do not have a good earth ground, and a friend suggested that
I place a length of 4 aught solid copper from a ground stake, up to my
second floor
window, and then to my ham rig. I then started thinking about the skin
effect
and started wondering if I should use the solid copper wire or a
large gage wire braid? Any opinions on this?

Thanks

Chip

Braid will generally have a larger surface area than solid wire
therefore it would be better from an RF standpoint, due to the skin
effect. On the other hand, the length from ground to the second floor
is great enough that it's probably not going to be a reliable RF
ground anyway. If all you're providing is lightning protection then
it won't matter much if you use braid or wire.

I had the same discussion with my electrician and we decided to use #4 stranded. The ground to the "box" goes back to the "street side" of the water meter.

When the ground was "fixed" I suddenly did not have triggering problems with my Tektronix 545A! (It was a problem on one of the outlets.)

Sometimes the least expensive fixes just work wonders. (in photography, investment in a decent tripod is better than investment in an expensive lens.)

What is this - starting a new message with OK - are you related to Shania Twain ?

Use broad flat copper strip, as wide as you can find, but don't expect it to be like a true ground. If you are after a fake ground for the RF, you can make several counterpoises, one for each band, a quarter wavelength long, trailed where convenient and all connected together.

Ya need good old iron for low frequency.
Ferrite is only good for high frequencies.
I'm sure others can suggest the minimum
frequency for ferrite, but is's not 60Hz.

4096. FS: MMICs, RF components for builders (long)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-12 00:00:00 UTC
From: Brad Thompson <Brad_Thompson@pop.valley.net>
Message-ID: <382C30E5.24AD@pop.valley.net>
Source record: 65712

Hello-- Revised 11/12/99

I'm offering homebrew builders oddball, offbeat and hard-to-find NOS RF components, including...
***
Hewlett-Packard MSA-0786 MMICs ($1.00 each, $5.00 for 6, $10.00 for 15, or $25.00 for 50 pieces); DC-2 GHz. These are taped and reeled and have leads configured for surface-mounted applications. Specs are available at...
http://www.hp.com/HP-COMP/index.html
***
1N5711 Schottky diodes, full-length leads, taped and reeled, $1.00 for 10
pieces
***
1N5821 Schottky rectifiers, full-length leads, bulk packed, $1.00 for 8 pieces
***
PIN diodes, no other specs available; full-length axial-leaded packages; individually serialized in sealed-foil envelopes. $1.00 each.
***
Minicircuits T4-1 (4:1 ratio) and T1-1T (1:1 ratio) broadband RF transformers-- $1.00 for 3; DIP-packaged. Visit www.minicircuits.com for full specs via their catalog.
***
Minicircuits PSCQ-2-400 90-degree, 2-way power divider, 0.9 dB insertion loss, 225-400 MHz; $1.00 each
***
Fair-Rite cores (both type 43 mix):

2643023002 (a long-cored toroid) $1.00 for 10 pieces
2843002402 (binocular (balun) core) $1.00 for 20 pieces
***
SD-201 Signetics DC-2 GHz DMOS single-gate FETs four-lead TO-72 can (like TO-18 w/shield lead). A conductive-rubber antistatic "O" ring encircles
all four leads. Specs (available on request and with purchase) include S parameter plots. $1.00 each, $3.00 for 6, $5.00 for 12 pieces.
***
SAW-stabilized oscillators; intended for ECL circuits, but also reportedly usable as LOs. All are packaged in metal DIP cans. $4.00 each, or three assorted for $10.00

Frequencies available are:
350.000 MHZ (RF Monolithics HC1301)

366.667 MHz
400.000 MHz ($2.00 ea. but not NOS; removed from PC boards)
733.333 MHz
***
Also, I have Teflon- and diallyl-pthalate insulated single-point turret lugs at $12.00 per 100 (many styles available-- e-mail a request for information and a jpg image showing various types).
***
Feedthrough capacitors: Spectrum Control 100 pf nominal (threaded bushing mount, hardware included). Attenuation is specified as -10 dB at 300 MHz, and -20 dB at 1 GHz.
$.50 each, $1.00 for 3 pieces.
***
Trimmer capacitors(USED and ABUSED): Johanson upright PC mount, 2-15 pf multiturn piston capacitor. A drop of brown Glyptal varnish secures each capacitor's adjustment screw. A dab of Zip-Strip (a methylene chloride-based paint remover available in hardware stores) softens the Glyptal, allowing readjustment. Some solder residue is present on terminals, and on some trimmers a through-hole solder tab may be missing. Price: $1.00 for 10 pieces; $2.00 for 25 pieces
***
Air-variable capacitors manufactured by Cardwell (their part no. PL6348).
NOS surplus, m'fd. sometime in the 1950s.
--Configuration: consists of two plates separated by 0.1";
--Estimated capacitance range: 1-5 pf.
The adjustment shaft is 0.25" dia. by 0.5 inches long; bushing or isolated mounting; easily disassembled for capacitance vs. frequency modification, etc. A more-detailed description is available on request.

Price: $3.00 each, $10.00 for 5 pieces, $20.00 for 12 pieces.
***
Caddock MS281N NONINDUCTIVE resistors:

10 ohm +/- 5 per cent tolerance, 8 watt noninductive power film resistors
Tinned axial leads (0.75 inches long) are formed for PC-board insertion on 1.2-inch centers. These are NOS, bulk-packed parts.
Note: these measure well within tolerance at +/- 0.2 ohms typical. Full specs are available in PDF format on Caddock's web site (www.caddock.com)
but highlights are:
--Temperature coefficient of resistance: 50 ppm;
--Power rating: 8 watts at 25 C, derating to 4 watts at 150 C and 0 watts at 275 C;
--Noninductive design: serpentine film layout cancels magnetic field-equivalent inductance of a straight piece of wire of the resistor's body plus lead length.

Applications include:
--Current sampling;

--Cathode bias;
--Dummy loads for audio and RF applications.

Price: $1.00 each ($10.00 for 12 pieces); only 70 pieces available
****
Six-lug terminal strips, like Keystone p/n 825: six isolated, tinned steel lugs mounted on a brown phenolic insulating strip, arranged in groups of three on either side of a central mounting bracket. There's no center grounding lug, but you can add a jumper to an adjacent lug or two as required. Tie-point strips work well for breadboarding if you use unetched-copper PC board laminate as a ground plane.

The lugs are spaced on 0.375-inch centers; mounting bracket has a 0.140-inch hole (use a 6-32 screw for chassis mounting).

I've sold thousands of these, but my supply is running low. Buy a batch now before they all go to good homes<g>.

Prices: $.15 each, or $6.00 per 50 pieces, $10.00 per 100 pieces.

****
* NOS Warranty policy *
****
Scanned images or digital photos of components are available on request.

If you purchase NOS tubes or components and find them unsatisfactory upon your inspection, notify me within seven days and return items in as-received condition for a full refund or replacement (if available).

This material is subject to prior sale and is supplied as-is, as new-old-stock (NOS) merchandise, with all responsibility for safe and successful application residing solely with the purchaser.

If you're searching for oddball components of any vintage, don't hesitate to inquire about availability.

****
* Shipping per order: *
****
Postage:

Add $3.20 for priority-mail shipment (U.S. only).
Foreign purchasers: please inquire for shipping charges.

Please contact me to confirm availability and reserve components before sending payments.

I accept payment via personal or cashier's check or money order drawn in U.S. dollars and made payable to "Brad Thompson".

List Of Stamp Applications (L.O.S.A for short)
==========

If you have done something (big or small) with the BASIC Stamp
that you are willing to tell others please use the form below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Then e-mail the form to:

cj@hth.com

With the following as the subject:

L.O.S.A Contribution

Or you could point your Web-browser to the following URL and fill
in the L.O.S.A form on the Web-page...

OBSERVE! NEW URL - UPDATE YOUR LINKS AND BOOKMARKS

http://www.hth.com/losa/

The latest version of L.O.S.A is always available at the above
mentioned both in ASCII and in ZIP-file format for easy download.
An index of L.O.S.A is posted to the following mailing lists and
news groups, I will update it approx. once a month.

Mailing lists:

BASIC Stamp Mailing List

News groups:

comp.robotics.misc
comp.home.automation
sci.electronics
sci.electronics.misc

Source record: 65719

I am selling 29 assorted delay relay tubes. These were included with a bunch of tubes that I recently bought from a retired repair guy. He claimed that these are all new/unused, but have been reboxed into plain white cartons. They appear new, but since my tube hobbyist activities are limited to audio, I have no way to test or verify them, therefore I must sell them "as-is".

I would prefer to sell the whole lot to a single buyer to make things easy, but I will consider breaking the lot up if I can't find a home for the whole pile. The list is at the end of this post.

Please make offers by EMAIL (do not post).

> ClearSpeech device.

The hardware is straightforward: if I wanted to build such
a device I'd start with a cheap DSP eval board (e.g. ADSP-2181
EZKit Lite - I already own one :-), add an audio amplifier for
the output, and then wrap the thing up in a housing with cables
and such.

The hard part is the programming. Some noise-reduction algorithms
are straightforward (my homemade weather satellite demodulator
program uses an LMS adaptive filter to good effect), while others
(e.g. spectral subtraction) are more complicated, but well docu-
mented. Done right they work well. Done wrong they sound really
weird...

Still others are out-and-out proprietary. You're not going to
get them, except by buying the product.

Reference: any non-trivial textbook on DSP. The new edition
of Rohde's communications receivers book discusses some of this
too.

I suppose it is only for 1-30MHz, so really any carbon resistors will
do

4107. Re: Pins of anzac MD-108 mixer ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-12 00:00:00 UTC
From: NANCY GIANAKOPOULOS <n.gianakopoulos@worldnet.att.net>
Message-ID: <80ijtt$h3f$1@bgtnsc01.worldnet.att.net>
Source record: 65723

The pin-outs for this device are as follows: LO = pins 1 and 5, RF = pin 8, and IF = pins 3 and 7. This device has a conversion loss of 7dB typical. The frequency range is 5 to 500 MHz.
I think a Mini-Circuits TUF-3 or a SRA-3 would be a better choice; their low frequency cutoffs are 150KHz and 25KHz respectively. The conversion loss of these devices is right around 4.7dB. The TUF-3 is around 4 dollars, while the SRA-3 is around 16 dollars. I have been using the "3" series of mixers in my own receiver designs for several years, and they have actually measured pretty good down to about 10KHz. If you really want to receive down low, the SRA-6 will work down to 3KHz, while the SRA-8 will work all the way down to 500Hz!
For information on these devices, you can reach Mini-Circuits at 800 654-7949,

4111. Availability of MC13136/MC13135 in dip package

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-13 00:00:00 UTC
From: Francois Nel <fnel@firga.sun.ac.za>
Message-ID: <382D23E9.D2D785A8@firga.sun.ac.za>
Source record: 65727

Hi !

I have implemented the MC13136 IC and had great succes with it.
The problem is that it is only in surface mount available in South
Africa.
The reason why I prefer the dip package over the surface mount is that
we
are busy in the design/implementation of economical 2m xtal receiver for
school
pupils especsally to receive signals from SUNSAT(Stellenbosch University
Satellite)(SO35).
The idear is that the school pupils must build the receiver themselves.

Does any one know where one can find the dippackage MC13135 or MC13136
IC's.

Is their may be other IC's that has the same function as the
MC13136/MC13135.
The MC3362 and MC3363 are the previous generation IC's of the MC13136
and MC13135.

I assume that you are using an end-fed antenna, otherwise you won't really be needing an RF earth connection. My shack is upstairs in a two-storey house. For a simple inverted-L end-fed antenna, I recommend feeding it with coax (the best, lowest-loss coax, possibly scrounged from you local CATV company!). Coax runs from shack to far end of the garden, where there is a good earthing system connected to the braid. Antenna length is appx 150'. An ATU in the shack takes care of whatever SWR is presented at the shack end of the coax.

A high SWR on the coax does not necessarily mean unacceptably high power loss (many purists dispute this, but it's true). I reckon that I could be losing about 3dB (half an S-point) where the SWR is worst (20m). This is a small price to pay for a simple, TVI resistant, multi-band antenna. You can experiment with somewhat different antenna lengths if the SWR /loss is too high on your favourite band. The shack is totally 'RF dead' (and I don't mean that the antenna isn't radiating!). Most critics of this system have a phobia about ATUs, for various reasons (fiddlyness, additional loss, COAX burn-out (!), 'my ATU won't handle funny impedances' etc).

73,
Ian.

4115. How does R/C network act as filter? (Audio Amp. question)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-13 00:00:00 UTC
From: JGinNY <jgovost1@twcny.rr.com>
Message-ID: <382DA1D6.B508C782@twcny.rr.com>
Source record: 65731

I have a 7868 pentode acting as a single-ended audio amp. The screen voltage of abt. 280V is supplied from B+ thru a dropping resistor.

Also connected to the screen is a 220K resistor, which leads to a (10 K resistor and .001 mfd capacitor, in parallel), going to ground. AFAIK this is some type of filter, perhaps to drain hash off the screen, but I'm not sure. (?)

Which leads to my question -- how does a paralleled resistor and cap to ground act as a filter? Is there some time-constant involved? What frequencies are drained off, then, and according to what parameters? Does it only depend on the value of C?

Or are the resistors and cap coming off the screen performing some other function?

Can't find any similar examples explained in any of the handbooks.

Many thanks for any help on this...

Joel

4117. Disable Linear Fan?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-13 00:00:00 UTC
From: Bill <jobes@bellatlantic.net>
Message-ID: <382DB366.B6FD5DFD@bellatlantic.net>
Source record: 65733

I have an old Dentron GLA-1000 running four 6LQ6's.
It is extremely well-ventilated with holes on top, back and sides.
Problem is: the 'cooling' fan is very noisy.
And, it seems to move precious little air.
I'm considering disabling the fan, and would like advice on this, as
well as hearing from anyone who's done this.
With all the case ventilation, the tubes are essentially in open air,
with nothing above them and to the sides.
Comments appreciated to the list, or via email.
73,
Bill W3WJ

4119. FS: Crystal Filters

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-13 00:00:00 UTC
From: Bob <bmiller@calweb.com>
Message-ID: <382dde8b_2@news.calweb.com>
Source record: 65735
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.swap,sci.electronics.components

For Sale: Pair of new crystal filters.
(6 sets available)

Filter 1 is a nominal 3.2 Khz bandwidth, brick wall, 7 crystal elements,
termination around 560 ohms to 1 k. 5.2 MHz corner frequency

Filter 2 is approximately 200 Hz wide centered on 5.2 MHz

Includes 5.2 Mhz injection oscillator crystal which will provide USB
injection for the 3.2 Khz filter and band center injection for filter 2.
These units are NEW maintenance spares for Motorola DTL FDM multiplex
modems. Great for home brew receivers and hi fi SSB generators. 200 hz
filter is
kind of narrow for cw, but great for nsk low speed data.

$25 for all the three items post paid conus

Thank you for the read.

4120. Headset for Icom 706

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-13 00:00:00 UTC
From: Bill <bill@hovac.com>
Message-ID: <382de7f0_7@news.newsfeeds.com>
Source record: 65736

Has anyone come up with an inexpensive homebrew headset to work with the Icom 706? I am not really interested in the ear piece just a headset for a microphone for working mobile. I see Radio Shack and some other electronic stores sell phone head sets for around $20. Anyway to make one work without using a preamp?

Thanks in advance.

73

Bill

4121. FS or Trade Xmfrs, line filter

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-13 00:00:00 UTC
From: gilsondp@aol.com
Message-ID: <19991113182216.22601.00000852@ng-fk1.aol.com>
Source record: 65737

I have four xfmrs which might be of use to someone and am willing to sell or swap. Xfmr descriptions are: KENYON TRANFORMER TYPE T 655. This one has 6 terminals and none appear to be open or shorted. Appears to be a center tapped xfmr. No other info on it. Anothe is labeled KENYON TYPE T 178 and has two terminals, appears to be a choke. Another is made by Raytheon and labeled MIL-T-27 Filament Transformer and has 8 terminals and all appear ok, have checked with meter. The terminals are labeled:
Terms Volts Amp AC Work V
1-2 115 1.25 175
3-4 6.3 12.0 175
5-6 6.3 6.25 175
7-8 6.3 1.5 1000

And the fourth xfmr has just a label with TRANS D161912 and has 10 terminals and I would guess it is still another filament xfmr. They all check ok except for terminals 7 - 8 which appear to be open. And last, I have an input line filter made by CORNELL-DUBILIER labeled NF21004, 4X25 AMP, 250 VAC 60 Hz Line Filter. These items are all pretty hefty, so be prepared for likewise hefty shipping charges! As for my swap wants, need tuning knobs for an SX-110, bandswitch knobs for S-38, a manual for an R-390A, a bezel for a SX-73, and am trying to locate a copy of a 1953 edition of "How to become a Radio Amateur". Thanks.

4122. Help with HTX-202

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-13 00:00:00 UTC
From: Dave Ward <dward@kos.net>
Message-ID: <382E0312.9563D62B@kos.net>
Source record: 65738

I recently misplaced my Radio Shack HTX-202 2 meter handi for about 5 days. It was left outside and during that period there was a heavy rain. I eventually found it but of course it was waterlogged. I opened it up, let it dry out, cleaned it up with isopropyl alchohol and reassembled it. I did the same with the nicad battery pack.

Next I connected the radio to an external 12 volt battery pack. I turned it on, everything seemed OK. I checked in to the local repeater and had a 5 minute conversation. The other person said everything sounded OK.

Now here is the problem. A few hours later I connected the nicad battery pack and turned the radio on. There was a little pop from the speaker and the screen went blank. I went back to the external 12 volt battery; now when I turn on the radio the correct frequency flashes on the display for a fraction of a second then the message "Er2" flashes on the screen. The manual says Er2 means "PLL Unlock Error: Er2 indicates the transceiver's PLL section has unlocked. Have the transceiver repaired by an authorized RS service center."

I measured the voltage of the defective Nicad battery pack, it is about 7.8 volts; a little higher than I would have thought but reasonable for the radio.

My question is this. What does the Er2 message actually indicate and can it be easily repaired at home or do I need to send it to RS for repairs.

Thanks in advance

Dave VE3BIP

4123. Re: Disable Linear Fan?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-13 00:00:00 UTC
From: Bob <balbert@cnmnetwork.com>
Message-ID: <sLnX3.95053$y45.1438157@news4.giganews.com>
Source record: 65739

If the fan is moving any air at all, disabling it will raise the temperature of the components in the amplifier, shortening their life. It may not just be the tubes that need cooling; there are bleeder resistors, chokes, the tube sockets, and so on.

Perhaps a better solution would be to replace the fan with a quieter one. If a fan is noisy, it may be the bearings, or it's not mounted securely, or it has poorly designed blades. Replacing it with a better unit should solve the problem.

The resistor, with the dropping one, forms a voltage divider, that
stabilizes the screen voltage a little bit. The capacitor decouples the
AC present at the screen to maintain the tube gain. But the time
constant involved depends on the dropping resistor value that you
haven't told.

I need a control box for AN/ARC-27A restoration project. The ARC-27A is a '50's aircraft UHF transceiver. Any of the following types will do the job:

Radio Set Control C-1015/ARC-27A, C-1024/ARC-27A, C-1025-ARC-27A or C-1827-ARC-55.

I could also use a mount MT-882/ARC-27 and the Front Panel Blower B1401 (double-ended squirrel-cage blower, 27.5V DC)

Thanks,

John Mackesy

You need a TNC, Terminal Node Controller to connect between the computer serial port and the radio. Software is the easy part, and it's readily available.

A good TNC will cost you around $100 used. I'm not sure about the SSTV stuff but most multi-mode TNCs will decode the majority of data signals on the radio.

I use the AEA (company now gone) model PK-232MBX. Those go for around $125 more or less on the used market.

From: Chuck <cmilhorn@yahoo.com>
Message-ID: <s2ulqbevhsq57@corp.supernews.com>
Source record: 65613

I recently ordered a Pixie 2 transceiver kit. Included with it is a crystal for 80 meters. This rig is supposed to cover 10-160m simply by changing the crystal and L3 in the circuit. However, the instructions do not include the L3 value for 30-10 meters. The value of the 80m inductor (L3) is 2.2 microhenrys and it is 1.2 microhenrys for 40 meter work. Can anyone tell me the values for the other bands or the formula used to determine them? Thanks!!

Chuck

4152. Looking for a rare component

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-14 00:00:00 UTC
From: Bahremu <bahremu@yahoo.com>
Message-ID: <80ntes0c9f@enews4.newsguy.com>
Source record: 65618

I have a pair of digital UHF transceivers adn want to convert them over to audio use with as little fuss as possible. What i need to do this is a 4 bit, 1200 samples per second analog to digital converter and a matching digital to analogue converter. I know it will sound pretty bad at that low of a sampling rate but it is the best i can do with 4800 baud equipment. Does a part like that even exist?

4153. Re: The best ground? solid wire/braid

Newsgroup: rec.radio.amateur.homebrew

Source record: 65619

The message <80h753$o1m@newton.cc.rl.ac.uk>
from "Mike" <m.j.willis @rl.ac.uk> contains these words:

> Use broad flat copper strip, as wide as you can find, but don't expect it to
> be like a true ground. If you are after a fake ground for the RF, you can
> make several counterpoises, one for each band, a quarter wavelength long,
> trailed where convenient and all connected together.
==========
You can make a simple tuned counterpoise by inserting a roller
coaster or multi tapped inductor in series with a variable capacitor .
Add a current sensor ie a RF toroid and a secundary winding with a
resistor,diode,capacitor and a microamp meter ,its deflection
adjustable with a potmeter. MFJ sell it as a ready made unit :
MFJ-931 Artificial RF Ground.
A number of years ago it was discussed in QST by Doug DeMaw , W1FB (now SK)
W1FB inserted the unit between his FT-101E and a random length of
18AWG hookup wire (length approx 24 ft) on the floor. When series
resonance circuit is tuned ,current is optimal.

I made one myself ,having the luxury of a roller coaster inductor and
it works well
But a switch-tapped inductor 0.9 -43 micro Henry is the one fitted in
the MFJ unit. Variable capacitor is 225 pF (or 2 sections of a BC rx
500 pF variable capacitor in series). Variable capacitor to be
insulated from chassis and operator.

If you want voice bandwidth, it will sound worse than bad! If you add alias protection, you'll be limited to about 500Hz bandwidth, and without alias protection, it will sound really, really "funny." It's easy enough to get 4-bit conversions: just get 8-bit converters and ignore the low-order bits from the ADC and ground the low order bits on the DAC. For the DAC, you can just use some resistors driven by FET switches if you want, though a DAC is simpler and almost as cheap. See the DigiKey catalog or web pages, for example...or see manufacturer's web pages such as National Semi.

There are also compression techniques that might help out, but they make it somewhat more complicated. The rate is a bit slow for audio bandwidth and delta modulation.

Sounds like trying to fit 25 pounds into a 5 pound bag...

Cheers,
Tom

I've built some tube style (one tube regeny and 3 tube MMRX) receivers that where fairly simple but now I would like to build a more complex one in hopes of receiving a better signal. The radio I have in mind has an IF transformer that is being used as a filter and the information given in the article says that it is a 3600KHz IF transformer. From what I can gather this transformer is something like the 455KHz in can transformer that I used in another project. I got the 455KHz IF out of an old am radio. I've got catalogs from several places like Ocean State but I can't find any reference in any of them for a 3600KHz IF Transformer. Can someone tell me where I can get such a thing?

Greetings,

I'm wondering about the Eimac 4CX600JB and it's use in a HF Linear project I'm about to undertake. Does anyone know anything or have any experience with this thing? I have a chance to buy some pulls at what I think is a fair price ($45 ea)??? but don't know for sure. Would this work in the VHF ranges as well?

My alternate 'low-cost' choice is a pair of 4-400As which have just been given to me but am told that they won't work well much above 100MHz.

Thanks much!

Radio Shack used to sell 20 watt, 8 ohm non inductive resistors.
They go for about $2 each. 6 in series will yield 48 volts but
the resistors are +/- 5% tolerance, hence, it was easy to cherry
pick to get an exact 52 ohm load. Price was $12 and works great
up to a hundred watts for limited time periods.

4CX600JB is the low price version of the 4CX600J. All 4CX600J's work
with max power just up to 110 MHz.
4-400A operates with full power up to 110 MHz too but can work with
reduced power up to 150 MHz. You haven't told which max frequency you
want to operate.

From: Paul Redden <666146@ican.net>
Message-ID: <80qk32jdn1@news2.tor.accglobal.net>
Source record: 65638

Hi group;

I'm an Electrotech student working on a college project.

It's a 40 meter Direct Conversion receiver.
Front end is a 7 MHz passive BPF and FET preamp.
Colpitt's VCO LO (quite stable and in its own box) into a SBL-1 mixer.
Then an active BPF with a TL072 op-amp.
The audio amp is a LM386.

The receiver pulls in a lot of stuff. The problem is as I tune to a powerful station the whistle and howling get louder and lower in pitch, almost like it will "motorboat". Right on the station the noise stops. Is this the carrier? How can I eliminate it?
On the weak stations it sounds more or less like the usual Short Wave whistles.

Thanks for any suggestions
Regards;
Paul

From: Roy Lewallen <w7el@eznec.com>
Message-ID: <38311D2E.FE00B708@eznec.com>
Source record: 65544

What you're hearing is the beat note (difference frequency) between the AM station's carrier and the receiver's local oscillator. When the two are 1 kHz apart, for example, you hear a 1 kHz tone. When they're at the same frequency, the beat note is at zero frequency (DC), so you don't hear it. This is inherent in direct conversion receivers. Direct conversion receivers are great for listening to CW (where the beat note carries the information) or SSB (where there is no carrier), but they aren't generally used for AM because of what you've observed. There are ways to lock the oscillator to the AM station's carrier, or to use a signal derived from the carrier in place of the local oscillator. These methods are referred to as "homodyne" detection. I've never tried this; perhaps someone else with some experience could comment more on it if you're interested. It's likely to add considerable complexity to an otherwise simple receiver.

KVG has a web site (I accessed it some time ago). You might find the
info. there.

Source record: 65555

Greetings,

I'm about ready to take my novice/tech class license test and want to start building my stuff. For now I'm only interested in homebuilt ham stuff and would like to start using up some of my leftover audio stuff if I can. I have a bunch of EL34/6CA7 and EL84/6BQ5 glass laying around and am wondering if anyone has used them successfully in HF transmitter/amplifier gear? From the books I have the EL34 looks as though it would do as well or better than the 6L6 but am not sure. It can tolerate a higher plate voltage anyway. I'll probably end up trying 'em anyway ;-).

Thoughts???

Thanks much to all who respond.

Source record: 65556

I see no reason those tubes won't work in RF applications. The EL84 is much like a 6V6 and will probably be able to run 10 Watts or so. The EL34 should be good single ended in a 50 Watt rig. I don't think they'd do well much above 20 or 30 MHz unless you are pretty careful with construction techniques.

Background: This is for fun and my education.

I've seen plans for, and have built 2m jpole antennas. Lots of fun, formulas, and I generally even understand what's going on.

Problem is, while I've seen a couple of plans for VHF 5/8 and 1/2 wave verticals (like in the ARRL antenna handbook), I haven't found any formulas for the coils in the VHF range. Likewise for coils, rather than 1/4 wave stubs, used for collinear arrays.

Anybody have any formulas?

Thanks in advance.

Because I remembered some exceptions, I just checked, and it is 500
ohms for the XF-9nb.

Wes Hayward had a high performance CW receiver in QST, and a somewhat
modified version appears in "Solid State Design" from the ARRL. He'd
ended up with some non standard filters from KVG and used those originally.
I'd wondered if the XF-9nb was that item, so I checked in the book. It
was another number, but he suggested the XF-9nb since the original
was no longer available. . The text specifically mentions 500ohms
termination for the XF-9nb unlike the oddball filter he originally used
which had lower values for termination.

The schematic shows a 30pF trimmer across the output of the original filter.
I did do a brief search, and while I didn't find another circuit using
the XF-9nb, I did come across one using an SS-bandwidth KVG filter
with trimmers across the input and output. I'm not sure if that
was considered an important part of the matching, or just allowed for
a little extra improvement for the KVG filters, but for a narrow band
filter like the XF-9nb, it might be an important consideration.

The answer is 10 Watts for the original, 20 Watts for the MK2 and probably
50W for the MK3. You will note I quote the maximum output. This is because
the rig produces a spike of RF at this maximum level regardless of what the
output setting is. The quoted minimum output is under a watt. You may be
able to fix this using the ALC input or if you really are only ever going to
use it for microwaves, by bypassing the 144 MHz PA. Perhaps you can find one
cheap with the bust PA syndrome ?

>
> Harold

It's a shame the magazines don't put their cummulative indexes on the web,
so it would be easier to track down things. They've all traditionally
sold back issues (or photocopies of articles if the issue is sold out),
and the index would complement that.

Since I rarely get CQ, I can't help you with the issue. But the scheme
of a converter ahead of a regenerative detector was common years ago,
and were sometimes referred to as "super-gainers".

Frank Jones, who was well known for his VHF work, and helped to
start the Radio handbook that now bears Bill Orr's name, apparently
pushed the idea a long time ago. Somewhere around here, I have
an article of his from CQ from the late fifties where he updated the
idea.

I've also seen a pair of articles about such a receiver in CQ in the late
fifties or early sixties, which I think included a crystal filter.

You'd see the scheme quite a bit in Popular Electronics during the
sxities, since it was still fairly simple, but gave good performance.
In some cases, for VHF use, the detector would be superregenerative.

And when transistors were starting to be used in hobby circles,
the scheme was seen in portable equipment. The idea seemed to
last until direct conversion hit the scene, at which point DC
receivers were everywhere until simple superhets took over.

A super-gainer is just a converter ahead of a regenerative receiver.
The regen becomes less finicky because it's on a fixed frequency (or
perhaps in some they provided a tuneable IF?), and isolated from
the antenna by the converter stage. Likewise, because it's not
on the signal frequency, it won't readiate a signal back into
the antenna. For the same reasons that you can make a more stable
VFO that doesn't switch frequency range, a regen probably benefits
from the converter being switched to change bands, instead of
plug in coils or a bandswitch that are traditionally seen in
regen receivers. The circuits I've seen used no, or minimal, IF
amplification. But some did put a crystal filter between the mixer

and the detector. The regen detector provides good gain with
minimal circuitry.

Was there anything magical about the circuit in CQ? You could
just build a regen detector on a fixed frequency, and then put
a converter ahead of it. Later you could add a crystal filter
of some sort. Converter circuits are fairly common; every
ARRL Handbook used to have a few. Finding regen circuits at this
time might require more effort, but there was an article in Communications
Quarterly a few years ago that gave an overview of regen receivers,
and some updated designs. I don't have the date handy. The same
author had a similar article in Electronics Now.

I'll save your message, and if I come across some references, and
remember, I'll email you at some point with the details.

> TNX
>
> Rick, KC0GIX

There was a time when electronic stores commonly sold radio components,
and they'd all carry (or could easily get) inductors and other coils.
While 3600KHz doesn't sound like a common frequency, you could get
transformers for frequencies other than 455KHz and 10.7MHz (which
at this point aren't commonly available either).

Some were specifically listed as "IF transformers" while others
would just be considered shielded LC circuits. The end application
would tend to define whether it was a front end coil, or an IF
transformer.

An obvious source at this point would be an older TV set. 4.5MHz
is the sound IF in North American tv sets, so if you could find
a junk tv set that is actually using shielded coils rather than
ceramic filters, you'd get a nice shielded coil. Either you could
pad it down with parallel capacitance, or use the coil form and
shiled to wind a coi[l for the lower frequency.

One consideration is the actual coil you desire. It will be easier
to find or make a single tuned circuit than a double-tuned transformer.
You can always add a few turns for coupling to an LC circuit, but
arranging a double-tuned circuit might require a fancier coil
form.

Or if the coil is tapped (such as in a crystal lattice filter, or
even a single crystal filter commonly seen in the old day) you
most likely will have to find a suitable coilform, and wind the
coil.

Some people have written in articles about padding 10.7MHz If transformers to other frequencies in the HF range (the capacitors usually sit outside the case, so you can break them off). Or using them as coil forms and rewinding. The same with 455KHz transformers, though they are more suitable for low frequencies because of the core material. The advantage of the 4.5MHz shielded coils in tv sets are that they are a bit bigger and thus easier to wind 9and get back together afterwards). Older tv sets in general are a good source of coil forms and shields, though since the IFs ae in teh 45MHz range, the core material may not be so great at HF.

4203. Trade EL34 for 807

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-17 00:00:00 UTC
From: "Randall D. DuCharme" <randyd@tcainternet.com>
Message-ID: <38327BDF.AABF0CEC@tcainternet.com>
Source record: 65569

Greetings,

Someone called and left a msg on voicemail offering to trade 807s or ???
for my EL34's. I inadvertantly deleted the message (wrong keypres)
before recording the phone ##. Please call again, or use email. My
home phone is less confusing to me <he he he> so you can call
501-442-9932 and leave a msg there if I'm out.

I only have 4 left but 1 is shorted. It's mate is in questionable
condition (lost the bias supply one night in a club) The other pair
are Sovtek EL34Gs and sound absolutely horrible in my Marshall. There's
probably less than 8 hours on the tubes though so they're not even
broken in <he he>. They're the only ones I'll get rid of. I wouldn't
trust the other questionable one as far as I could throw it.

Thanks for the call, whoever you were.

Hi Ron,

A one wave horizontal loop is anything BUT omni- it has a pattern very similar to a half wave dipole (very deep side nulls) BUT with about 2 dB LESS gain.

Subject:
MAKE MONEY FAST!!!
Date:
11 Nov 1999 15:36:57 PST
From:
"Chris Knight" <c_knight56@hotmail.com>
Organization:
Knight Industries
Newsgroups:
alt.shenanigans

A few days ago, i discovered this article within a newsgroup. This article
assured me I could wasily make thousands of dollars within weeks. The
article stated that all I had to do to get these results was send $1.00 to
each of the six names given within the article. I would then add my own
name and address at the bottom of this list (at position number 6) and post
the article in a minimum of 200 newsgroups. By the way, there are thousands
of newsgroups.

So after thinking it over, and talking to a few people first, I thought
about trying it. I figured what have I got to lose except 6 stamps and
$6.00, right?

Like most of us I was a little skeptical and a little worried about the
legal aspects of it all. So I checked it out with the US Post Office
(1-800-725-2161) and they confirmed that it is indeed legal!

Then I invested the measly $6.00...plus postage... well GUESS WHAT!!...
within 7 days, I started getting money in the mail! I was shocked! I still
figured it would end soon, and didn't give it another thought. But the
money just kept coming in. In my first week, I made about $20.00 to $30.00
dollars. by the end of the second week I had made a total of over $1,000!
In the third week I had over $10,000.00 and it's still growing. This is now
my fourth week and I have made a totoal of just over $42,000.00 and it's

still coming in rapidly...

It's certainly worth $6.00, and 6 stamps, I spend more than that at McDonald's!

Let me tell you how this works and most importantly, why it works... so,

make sure you print a copy of this article NOW, so you can get the information off of it as you need it. The process is very simple and consists of 3 easy steps:

Step 1:
Get 6 separate sheets of paper then write the following on each: "Please

put me on your mailing list."

Now get 6 US $1.00 bills (or equivalent in your local currency) and place
ONE inside EACH of the 6 sheets of paper so the bill will not be seen through the envelope to prevent thievery. Next, place on paper in each of
the 6 envelopes and seal them. You should now have 6 sealed envelopes, each
with a sheet of paper stating the above phrase, your name and address, and a
$1.00 bill. What your are doing is creatign a service by this. This is absolutely legal! Mail the 6 envelopes to the following addresses:

#1 Kevin Brooks
PO Box 309568
Denton, TX 76203

#2 Yaw Bonsu
1113 Abrams Rd #174
Richardson, TX 75081

#3 Karina Gomez
10770 NW 40th St
Sunrise, FL 33351

#4 T. Smith
2769 Jester Lane
Columbus, OH 43231

#5 S. Moss
13803 108th AVE NE
Kirkland, WA 98034

#6 O. Salinas
P.O. Box 270962
Dallas, Texas 75227-0962

Now take the #1 name off the list tha tyou see aboe, move the other names up
(6 becomes 5, 5 becomes 4, etc...) and add Your name as number 6 on the list.

Step #: Change anything you need to, but try to keep this article as close
to original as possible. Now, post your amendee article toa t least 200
newsgroups. Remember, there are tens of thousands of newsgroups and more

are being added every day! All you need is 200, but the more you post the
more money you make!

That's it! all you have to do is jump to different newsgroups and post away,
after you get the hang of it, it will take about 30 seconds for each
newsgroup!

**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL
MAKE!!
BUT YOU HAVE TO POST A MINIMUM OF 200**

That's it! You will begin receiving money from around the world within
day's! You may eventually want to rent a PO Box due to the large amount of
mail/money you receive. If you wish to stay anonymous, you can invent a
name to use as long as the postman will deliver it.

JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT

P.S. Don't know How to post in the newsgroups? Well do exactly the
following
below:

DIRECTIONS - HOW TO POST TO NEWSGROUPS
1. You do not need to re-tup this entire letter to do your own posting.
Right mouse click somewhere in this document and then click on
"select-all". At this point the entire letter should be highlighted.
Then,
from the
'edit' pull down menu at the top of you screen select 'copy'. This will
copy the entire letter intot he computers memory.

2. Open a blank 'notepad' file and place your cursor at the tope of the
blank page. From the 'edit' pull down menu select 'paste'. This will
paste
a copy of the letter into notepad so that you can add your name to the
list.
Remember to eliminate the #1 position, move everyone up a spot
(re-number
everyone else's positions), and add yourself in as #6.

3. Save your new notepad file as a .txt file. if you want to do your
posting in different sittings, you'll always have this file to go back
to.

(NETSCAPE USERS)
1. Within the Netscape program, go to the pull-down window entitled

'Window', select 'Netscape News'. Then from the pull down menu
'Options',
select 'Show all news groups'. After a few moments a list of all the
news
groups on your server will show up. Click on any news group you desire.
From within this news group, click on the 'TO NEWS' button, which should
be
in the top left corner of the news groups page. This will bring up a
message box.

2. Fill in the subject. This will be the header that everyone sees as
they scroll through the list of postings in a particular group.

3. Highlight the entire contents of your .txt file and copy them using
the same techniques as before. Go back to the news group 'TO NEWS'
posting
you are creating and paste the letter into the body of your posting.

4. Hit the 'Send' Button in the upper left corner.

(INTERNET EXPLORER USERS)
1. Go to news groups and select 'Post and Article'

2. Fill in the subject. This will be the header that everyone sees as
they scroll through the list of postings in a particular group.

3. Highlight the entire contents of your .txt file and copy them using
the same technique as before. go back to the news group 'TO NEWS"
posting
you are creating and paste the letter into the body of your posting.

4. Hit the 'Send' Button in the upper left corner.

(E MAIL USERS)
1. Start by e-mailing people that you know personally.

2. Go to any e-mail database and search under e-mail addresses. (There
are thousands of them!) E-mail everyone that you can.

THAT'S IT! All you have to dod is jump to different news groups and post

away, or e-mail it and after you get the hang of it, it will take about
30
seconds!

THE MORE YOU DO , THE MORE MONEY YOU WILL MAKE
That's it! You will begin receiving money from around the world within
days! Again, you may eventually want to rent a PO Box due to the large
amount of mail you receive. if you wish to stay anonymous, you can
invent a
name to use, as long as the postman will deliver to. Now the Why part:

Out of 200 postings, say I receive only 5 replies (a very low example).
So

then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of the original 5, that is

another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make and additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies that just made me $3,125.00!!! Those 3,125 persons will all deliver this message to 200 news groups with my name at #1 and if still 5 persons per 200 news groups react I will receive $15,625.00! With a original investment of only $6.00! AMAZING! And as I said 5 responses are actually VERY LOW! Averages are probable 20 to 30! Let's put those figures at just 15 responses per person. Here is what you will make:
at #6 $15.00
at #5 $225.00
at #4 $3,375.00
at #3 $50,625.00
at #2 $759,375.00
at #1 $11,390,625.00

When your name is no longer on the list, you just take the latest posting in the news groups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is, do you realize that thousands of people all over the world are joining the Internet and reading these articles everyday, JUST LIKE YOU are now!! So can you afford $6.00 and see if it really works?? I think so...

People have said, "What if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the Internet and news groups everyday and are willing to give it a try? Estimates are at

20,000 to 50,000 new users, every day, with thousands of those joining the
actual Internet. Remeber, play FAIRLY and HONESTLY and this will work. You
just have to be honest.

Make sure you print this article our RIGHT NOW, also. Try to keep a list of
everyone that sends you money and always keep an eye on the news groups to
make sure everyone is playing fairly. Remember, HONESTY IS THE BEST
POLICY.

You don't need to cheat the basic idea to make the money!

GOOD LUCK to all and please play fairly and enjoy the huge rewards from
this, which is tons of extra CASH.

I've had this problem a couple of times. When you run the radio at high power, off of 12V with the rubber duck is asking for this problem. Even Radio Shack advised not to do this in their manual! Go figure.

Try doing a simple reset. With the radio off, push the function button and the D key (I think that is the one, it is the one with Clear) and turn on the radio. This will do a hard reset, and erase all the mem's, and hopefully the problem. The ni-cad isn't a problem; the alkaline case runs at 9V.

I've done the reset a couple of times on my radio, when it did this error, and it cleared it up every time. So, don't fret yet! But if a reset or two doesn't fix it, well, time for a new radio.

Good luck.

==========================================================================
BSSClub proudly presents
==========================================================================

Project: ST1-64 PIC Basic Interpreter
Version: 2.0
New features:Added compiler into the intermediate code, developed
serial port downloading working under Windows.
Description: Basic Stamp I compatible firmware for 16C84 or
16F84 with 64 bytes of memory and intermediate code
compiler

ST1-64 is a virtual machine running on a PIC16C84 or PIC16F84
microcontroller that interprets the intermediate code, stored in
the internal on-chip 64 byte EEPROM memory. The machine is fully
compatible with Parallax Basic Stamp 1 Basic interpreter with the
only exception - the program memory has only 64 bytes. Now
the distribution includes its own compiler allowing both parallel
port and serial port downloading. When using serial port downloading
the systen does not need to be run under MS DOS and can be run
also under Windows, WIn95 and Win98.

The firmware and compiler can be downloaded free of charge from

http://www.geocities.com/SiliconValley/Cable/7772/

This software is property of BSSClub and you are free to use it
for your personal use as you see fit.

Hi Ray, OM

I am with you! REPAIRABILITY and MAINTAINABILITY are all too often lacking in many 'Hi-Tech' solutions today. It is a shame too, because they can be made very easy to troubleshoot and repair if designed right. For example, many of the Nissan microprocessor-controlled EFI cars of the last two decades allow you to single-step the processor with a clip lead, and read out the status with a light bulb, requiring zero test equipment ('79 280ZX). My '87 200SX has built-in selector switch and dual colored LED's that will flash out a code for you when put into the troubleshooting mode, all with zero test equipment required.

The California Air Resources Board (CARB) requires that automobiles be diagnosable with "shade tree mechanic" simple methods. Many of the Japanese carss found ways to gain exemption from this rule. Those are the brands to avoid, for starters.

New digitally-controlled equipment that is not comparable to older gear in these respects is poorly designed, and should be avoided. Using that critierion, it eliminates a lot of new products, and surely makes my buying decisions easier, HI!

73,
Don, W6JL

Want to try something different? Tired of building tube audio kits?
How about an AA5 style AM or Shortwave kit...5 tubes, 55 page manual,
6 hours of fun in an clear, see-thru and safe acrylic chassis in clear, clear
red or clear blue... You can make mods to add an S-meter, Bfo/gain, wind your
own
coils...sorry, you'll have do do some basic coil winding math...but that's what

homebrew is about, isn't it? Good starting platform for working with tubes,
adding
a filter, trying out another RF or IF stage...you name it!

Let us supply the parts and ship it to your door. NOS and new parts.
Visit our Mediumwave Associates website to find out more:

http://hometown.aol.com/weathrship/myhomepage/business.html

Thanks,
Mediumwave Associates

Thing is, in the "good old days" we used that biological computer between our ears. We knew approximately the voltage we were testing for, and had the brains to set our old Simpsons on the proper range, and to put the red lead on the positive side. Todays autoranging autopolarity digital whachamacallits assume we don't gots any brains 'tall. Ever try to "dip" a final with a digital meter?

Some tools I used to use (and still sometimes use) were deceptively simple. A number 48 lamp soldered to a couple of loops of wire, Letcher wires, NE-2 on the end of a stick ... etc.

I've been called a "minimalist" by my peers. I don't know if that's good or bad.

4213. Clock Recovery Device/Circuit

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-17 00:00:00 UTC
From: terry m fernandes <terrymf@ix.netcom.com>
Message-ID: <80vaskaup1@nntp9.atl.mindspring.net>
Source record: 65579

I am currently working on a SONET based design in which I need to extract/recover a clock from an
external BITS type source. The frequenies range from 8K, 1.544M, 2.048M, and 10M. These signals
come to my card as differential analog type signals, via twisted pair or coax. My objective is
to be able to recover/condition these clocks into a useable TTL signal prior to going into an
FPGA type device. Again, these are strictly clock signals, no data present on them.

My first thought for the 1.544/2.048 clocks was to use an E1/T1 type device, just the receiver
portion, since these devices extract the clocks as well as provide a Loss of Signal indicator to
a CPU. Unfortunately, these E1/T1 devices look for an AMI type signal, which is not the case for
my application.

Is there a circuit out there that will work for me; better yet, is there an IC or ICs that would
accomplish this task?

I am at terrymf@ix.netcom.com

thanks

4215. transmitter detection

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-17 00:00:00 UTC
From: kalle arulaane <arulaaneNOarSPAM@hot.ee.invalid>
Message-ID: <0034bbf1.e2ede170@usw-ex0110-073.remarq.com>
Source record: 65581

I wish to build a simple radio transmitter's detector. I
was thinking of connecting a regular antenna to a wide
range amplifier and converting the output to a DC signal,
which then could be easily monitored. Still, I have a few
problems:
1) The output of the amp is not not steady (a 33 dB 47MHz-
900MHz amp). Also, I do not have any equipment to monitor
high freq. signals.

2) what kind of a diode would be suitable for ac-dc
conversion?

thanks in advance,
Kalle Arulaane

I have heard of kites and balloons being used as antennas. I was wondering if anyine can point me in the direction of finding some information on this subject.

I'm a novice class ham, but spend most of my time playing w/ crystal radios. The Crystal radio Club in Yahoo clubs is putting on a DX contest in the near future and I want to try a ant of this type out on my crystal radio.

So, I would appericate any help you can give me..

4217. Re: transmitter detection

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-18 00:00:00 UTC
From: Tom Bruhns <tomb@lsid.hp.com>
Message-ID: <383457BF.22BF6C13@lsid.hp.com>
Source record: 65493

Some questions: Do you wish to detect transmissions by monitoring through the air? That is, could you connect directly to the transmitter, or must you receive the signal with an antenna? How much signal are you wanting to detect? That is, how powerful is the transmitter and how far will the detector be from it (assuming that you will detect through an antenna)?

If you are near the transmitter and it has enough power, then a very simple diode detector may do the trick. All amplification can be at DC. It's quite feasible to detect a 1 milliwatt signal at ten meters or more distance with just a diode detector, but there's a problem of false detection: if there are other signal sources in the frequency range that the detector is sensitive to, it could trigger on them. For example, with a simple diode detector field strength meter (with a high Q tuned circuit so I know what frequency I'm seeing), I can detect FM broadcast stations many kilometers (several tens of kilometers) from where I am. That could be a problem with any simple broadband detector, unless it can decode some characteristic of the transmitted signal that uniquely identifies it. That MIGHT be simply the fact that it's far and away the strongest signal at the point of detection, if you can arrange that.

If a diode detector would work for you, then simply a monopole antenna, an RF choke to "ground", a diode from the antenna-RFchoke node to a capacitor, other side of capacitor to ground, and then monitor the voltage on the capacitor. Ultimate sensitivity requires a voltage monitor with reasonably high input impedance and extremely low input bias current and offset voltage, but if you have strong signals, it could be as simple as a single bipolar transistor. The detector diode should be something like a fast signal diode, preferably a Schottky or germanium diode.

Cheers,
Tom

Doug OM,

I am a firm believer in "minimalist" philosophy. We need more minimalists around. It is a positive attribute, not a negative one. It is easier to make something more complicated, more expensive, more difficult to repair and maintain, have a higher selling price (sound like some brands of automobiles? you bet). What is much harder to do (and more valuable to me) is to make something with adequate performance but simple to use, own, and repair, at a minimum purchase price and cost of ownership.
However, I have seen the minimalist philosophy sometimes become distorted, into a cult mentality. Some environmentalists (greenies) and yes, even some QRP ops fall in that category. I have encountered on the air QRP enthusiasts who seem to believe that less power is always better, no matter what. Some will refuse to QRO on request, even though they can, to help the poor guy on the other end copy their very dim signal in poor conditions. It becomes almost a religion. As the old saying goes, a fanatic is someone who redoubles his efforts after losing sight of the goal.

73, and Keep It Simple

Yes and no. They can be *very* convenient. Just remember, like all tools,
each has its advantages and its disadvantages.

> There was a small commercial amplifier back in the late 1950s that sported a quartet of EL37s or EL34s in a grounded grid arrangement. The EL34s are a true pentode if memory serves and make nice grounded grid triodes. A youngster ham pal of mine back in the early 1960s ran a pair of EL34s in GG and they did quite well with about 600-800 volts on the plate.. Can't recall if he had to fun an control grid bias on them or not... but I think not. The only dilemma you have to face is if they are Mullards or Genelex or some other original OLD line manufacturer of HI FI tubes, they will command quite a price among the Tube Hi Fi nutsos and you may want ot just sell them and buy a bunch of 6146s or some other transmitting tube instead. Even the 6BQ5s, if old mfg, are worth more than their orignal price among the tube dudes. BTW the KT-88/6550 tube from the same HI FI era is used in the CE 100V and 200V exciters and do quite well up through 30 Mhz and the EL-34s, withing plate dissapation limits should do as well but at a slightly reduced power output. A pair of EL34s in GG SSB should do around 70 watts or more. Check the old CQ SSB handbook for details on the EL series tubes in SSB gear

A better bet may be an old CB radio - particularly one that uses the old Cybernet PLL02A or Uniden 858 chassis. Along with the schematic diagram and/or service manual. I've done this ages ago and learned a great deal in doing it. Granted, it isn't something you would normally gift-wrap. :->

Hi Paul !

All direct conversion receivers produce a note when tuning to an AM station - the AM carrier produces an audio tone equal to the frequency difference between your VCO frequ and the carrier freq.

It can help to have a good low frequency rolloff so that the beat note fades out as you get close to correct tuning. I suggest a high pass filter before the LM386 - rolling off sharply below 300 Hz. A single opamp active filter can be added with a "2-pole chebychev" response.

If the opamp sounds too tricky, try reducing any audio coupling capacitor(s). You are aiming for a clear "thin" or "tinny" sound - the low frequencies are not much use for communications anyway.

all the best
Roger

Wayne:
If you are interested in building this type transmitter, you should join the Glowbugs reflector. Some of the participants have built self-excited oscillator transmitters, often with cheaper and easier to find tubes than the 1928 article probably used. Let me know if you don't get the article. I'll need to look for that issue. It's stored away.

Check out e-bay auction for a used Radio Shack HTX-100. Search on "HTX-100".
You almost always get a hit. It's a pretty nice preassembled 10 meter radio
that usually goes for $130 to $170, depending on condition, phase of the moon,
and number of crazy bidders who want it. I got mine for $150.

Perhaps we too should use the same catalysts we used to make polyethylene in the 1950's,

In audio, I believe that tubes do sound better. Similarly, I believe that my TEK 545A is quite sufficient for some applications, it still has a rock hard trigger circuit after 40 years, and keeps the lab warm, (but I like my 2215 for a lot of other applications). The Heath tube signal tracer works great as does my Eico VTVM. MY LP recordings of George Szell sound better than the re-released CD's etc., etc.

The Hickock is fine for testing shorts and mutual conductance. People will pay $150 and up for a tube tester, however when, with a PIC or Atmel or Motorola micropcontroller and a computer running DOS you can run traces of all characteristics and probably for less than $20 (I assume you have an IP17 power supply somewhere around the house.) And if I can learn assembly language at my exalted age, then what the heck is stopping everyone else? Software is homebrewing anyway.

Besides, can you test a 4X150 on a Hickock?

and by the way, you can buy a DVM at RadioShack which has a bargraph display in addition to the numeric readout - for neutralizing a final. It also measures time, frequency, capacitance. tests transistors and measures logic 1 and 0. It also has a RS232 out!

It seems to me that you're missing the point. A kit may be wanted for
the sake of building it, not just because a kit is perceived to be cheaper
than an already built rig. The building of a kit may be as much fun,
and educational, as the actual use of the rig once it's finished.

Converting a CB set might fit the need, because changing something into
something that is useful feels good. It's an intermediate step,
with cheap and easy to get on one hand, and still some sense of
accomplishment on the other. And once a CB set is converted, someone
is more likely to modify it to fit their needs, since it was cheap
in the first place and they are already familiar with the rig, than
if they've bought a commercial rig that they worry about resale value
on.

4235. FRS newbie

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-18 00:00:00 UTC

Some questions about FRS

1. Does anyone know about a site that details the capabilities and restrictions concerning the use of FRS for commercial activities - is there a problem with tying up the frequency to transmit bursts of data?

2. Can this frequency support digital transmission?

3. Can distance from transmitted to receiver be accurately gauged depending on the power output to any degree of accuracy (5%-10%%)

4. Ideas about the cost of a transmitter? A receiver?

Please reply to post or lreed@alumni.prinNOSPAMceton.edu

4236. Instant Lettering for Panels etc?

My supply of Instant Letting for home-brew gear made by Datak Corp. seems to be too old and not transferring any longer. One of the packages has a Lafayette Radio price tag on it (must be old). Can't seem to find this item in the catalogs any longer. Is it still available? If not, what are home brewers using these days to label panels, dials etc.?

1. Here in Australia, instant lettering seems to be available in all the stationery shops (much more common than 25 years ago when I got my first Letraset ;-)

2. Recently, I had a front panel laser engraved in laminated plastic (Stippled black with white backing) $20 Aus. for a panel 249mm by 76mm. The result was "professional" - you would need a good magnifying glass to see the rough bits. All I had to do provide a GIF image on floppy disc - 300 dots per inch resolution was fine.

You can replicate a lot of this with Clear Avery Labels (try Staples or Office Depot - they are available in a variety of sizes) - you need to make a template of the faceplate so that you can acurately position the text using a word processing program or a graphics program.

Electronics World had an article on this in their most recent issue, but they didn't suggest the avery labels.

Did you know that your system is infected with the "Happy99" worm!! It attaches itself to all out going e-mail etc. as an EXE file. Once it has sent a copy to somebody it is logged in a file in your Windows folder so it will not send the person another copy.

You're OK as long as you don't run the EXE file. If you do, and see the little fireworks display, it's to late, your system is infected.

You will have to search around the Internet to find a program which will remove it.

I had a friend send that stinking worm to me, he didn't know it, and it infected my work computer. Wasted part of the morning tracking down the remove program to get rid of it.

Howdy.

I was asked to add a prefix look up utility. It is now available on the QSL page at http://hfradio.org - If you need to know where a prefix is from, simply enter the call or prefix and see what country it is assigned to.

Don't forget: http://hfradio.org, a non-commercial site offering:

+ Azimuth Map / Equidistant Map Creation (choose any QTH as center, many options)

+ Propagational Resources (live, real-time reports, eAlert service (sign up for automatic email solar/geo reports, complete with Aurora index))

+ News, and DX information and reports

+ QSL Manager and Callsign Lookup center

+ Swap and Shop

+ FREE HOME PAGES THAT YOU CAN USE TO POST YOUR OWN HAM OR SWL SITE

+ Bookstore - SWL and Ham related books. Over a 1000 titles so far.

+ Plus more (Directories, etc.)

This is my offering to the community, all funded by me. I am working hard to bring excellent content to the site. I have need for others who might wish to assist. I need a Software editor -- someone who can review and post software links, etc. Let me know if you are interested. (See the site on how to email me).

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

73!

I fully understand the point. I've been watching this thread since the original posting. and the poor guy doesn't have any solid leads for how to fulfill his son's Christmas wish. He never said that a kit was a requisite.
In the absence of perfect solution, an alternative is often appreciated.

Joe

Are there any HF amp kits avaliable any more? I would like to build my own amp but do not have the means to do the metal work. I can handle the electronics so I figured a kit would be my best option. I would like to build a HF amp and a 2m amplifier. Any help or suggestions would be appreciated. I guess plans would be ok if there was a source for the metalwork also.
Please reply to blueglow@mindspring.com

Yes - FRS is for voice communications ONLY.

"You may use an FRS unit to conduct two-way voice communications with another person. You may use the FRS unit to transmit one-way communications only to establish communications with another person, send an emergency message, provide traveler assistance, make a voice page, or to conduct a brief test."

Business use is OK - but nothing but voice.

What power level did you have in mind?

If you're looking for 20 watts up to 600 or so, you can get kits
for the Motorola Application Note amplifiers from folks like
Communications Concepts and Mainline.

If you want more than that you're almost certainly on your own.
References to "metalwork" usually imply a tube amp, and few of
the good designs require more than hand tools (and patience :-)
to make.

Big amplifiers need big power supplies (figure 50 volts at 50
amps for a big solid-state amplifier, 3000 volts at 1 amp for
a U.S. legal limit tube amp). This can be a bigger challenge
than the amplifier itself.

For something really nice (but expensive), have some small silver or brass nameplates engraved at a local trophy supplier. They can also be done in plastic.

Communication Concepts advertise regularly in the magazines,
and a very quick search of the web came up with:

http://www.communication-concepts.com

Mainline's web presence (http://www.mainlinegroup.co.uk)
only seems to be a placeholder, but their phone number last
time I ordered from them was +44 116 2777648. Probably
subject to yet another U.K. number reorganization. :-(

I you like to build a High Power amp using the very best parts
available, I have them. I gave up the project. These parts are all for
a twin 8877 AMP.
Two Eimac 8877/YU-158 Ultra Linear tubes with sockets, pulls $400 each.
Two Jennings 12-500PF CSVF Blue line 7.5KV Vac Variables with machine
mounts and shafts. These are the top of the line vacs. $400 each
Filament transformer for the twin 8877s $120
Hypersil Plate transformer for the twin 8877 $300
I have several Jennings Ceramic vac relays also

Everybody, the poster of this is foolish enough to ask people
to send him money to a PO box at the post office.

Please take a moment to print his email and forward it to:

Postmaster
Dallas, Texas 75227

with a note complaining about a postal lottery. And send a complaint
to his ISP, which would be abuse@swbell.net, and to the newshost where
the post originated from, which would be postmaster@ucsd.edu

Mr. Salinas will soon be sternly chastised.

If you are really rotten, you can inform the IRS on all five
people on the list, and tattle to the postmaster at the zip code
appearing with their address.

Answers (I won't quote your questions)

1. It's FAMILY radio service, not commercial. Regardless of mode, you can't use it for commercial service. FCC rules may regulate mode -- with the FCC's current enforcement climate, you may not want to test this. How big a data burst?

2. Absolutely yes, but within the limits of the license. Any frequency can support digital comm, but the available bandwidth limits usability.

3. Absolutely not, since it's UHF and prone to reflection and atmospheric vagaries. You should see what a few watts can do under tropo ducting conditions.

4. Starting around $49. for some nice Motorola transceivers.

Other bands are available, such as the 900 MHz ISM, with more lax regulation than FRS. In addition, you could develop your modulation schemes on amateur radio bands (within the limits of your license, of course) and port them to the nearest commercial band. Commercial licensing is neither free nor easy.

Drafting supply stores still carry ChartPak and perhaps other brands
of rub-on letters. Occasionally you may find a close-out on some
old styles that are really fun for projects -- but your best bet today
is to plan a new way to letter for the future. Some of the suggestions
on this NG are valid -- my favorite is to print to the backside of
a transparency (in reverse letters, of course) and flip the transparency
so it reads right and the letters are protected.

You can do this with both laser jet and ink jet technologies. Oh, and
while you can't rub on letters backwards, it's not a bad idea to
overlay rub-ons with a sheet of clear plastic. And my last purchase of
laser-printable transparencies was a super-close-out at Office-Doodle,
at 90% off list. $1 and change for 50 sheets.

Then again, if you favor the hard-core Luddite school of panel
lettering, you will letter by hand with India ink. There is something
to be said for a spidery hand-lettered panel.

>concerns
>73/Ib
>oz9dr

There is a whole family of 10811 oscillators with part numbers of the form 10811-6XXXX. The 10811A, which hasn't been made for at least 15 years, was a generic model number that referred to a particular 10811-6XXXX part number and was used for oscillators that were sold to customers outside of HP. After a brief time, HP decided not to sell outside and the crystal oscillator factory became a captive supplier. The current general purpose models are the 10811D with edge card connector and the 10811E with coaxial connectors. Again these are generic model numbers. Specific oscillators will have 10811-6XXXX. These various 6XXXX numbers refer to specific specifications that have to be met and are in general tighter than the "base" 10811D/E.
I don't happen to have the specific specs for 60111 handy.
Some suffixes were selected for good short term stability.
I'm not aware of any selected for good tempco. The tempco of any 10811 series is going to be at best a few parts in 10^9 over 50 degrees C. The worst are 4.5 parts in 10^9, the spec.
Even within a specific part number, the variation from oscillator to oscillator is substantial, especially short term stability and aging. So you really have to look at the two specific oscillators you have to compare them, not go by model numbers.
In the field of crystal oscillators, if you are looking for top performance, you always have to check the oscillator in question; they are kind of like wine that needs to be pretasted before serving. Do not overemphasize data sheets, specs and part numbers. They are somewhat analogous to wine reviews in magazines.

Hope that somewhat answers your question.

[BTW, I worked at the Agilent (formerly Hewlett-Packard) Santa Clara Division for 19 years and did some production engineering on 10811's, among other things.]

Do your _entire_ front panel in paper on a laser printer, including a
nice logo - use any color paper you like. Cut a piece of clear plastic
(1/16 inch plexiglas from hardware store) to fit over it. Make the
cabinet the "hooded" type in which the top and sides extend out a bit
from the front panel so that you cover the edges of the paper and
plastic.

>Thoughts???

There's no reason those tubes won't work in an HF rig, but you might want to reconsider for other reasons.

Those tubes are much in demand for audio applications. Other tube types, like the 807, 1625, and 6BG6, are much cheaper per RF watt. In addition, there is plenty of published data on using them as RF amplifiers. You'll have to design a 6CA7 or 6BQ5 RF amp from the ground up.

What sort of rig are you thinking of for a first project?

Micronetics of Geneve Switzerland has a lot of new tubes for sale at
prices so low that they very competitive even after adding shipping from

Switzerland. They are normally a wholesaler so they do not post prices
but will quote a price for one or more of a type for you quickly via
e-mail.

The inventory is available on my web site at:
http://www.aade.com/tubes/tubes.htm

They have many receiving tubes, Hi-Fi power tubes, transmitting tubes,
CRTs and even TV camera tubes.
For example CRTs are $5 each regardless of type.

I am not affiliated with Micronetics and host their inventory as a
service to the hobby and to draw people to my web site.

All questions, order, and payments should be made directly to
Micronetics.

jstrohm@texas.net wrote:

> 1. It's FAMILY radio service, not commercial. Regardless of mode,
> you can't use it for commercial service.

Not exactly correct.

From the FCC:

The Family Radio Service ("FRS") is one of the Citizens Band Radio Services. It is for your family, friends and associates to communicate among yourselves within your neighborhood and while on group outings. You cannot make a telephone call with a FRS unit. You may use your FRS unit for business-related communications. Expect a communication range of less than one mile.

FRS Rule 3 - Types of communications.

(a) You may use an FRS unit to conduct two-way voice communications with another person. You may use the FRS unit to transmit one-way communications only to establish communications with another person, send an emergency message, provide traveler assistance, make a voice page, or to conduct a brief test.

(b) The FRS unit may transmit tones to make contact or to continue communications with a particular FRS unit. If the tone is audible (more than 300 Hertz), it must last no longer than 15 seconds at one time. If the tone is subaudible (300 Hertz or less), it may be transmitted continuously only while you are talking.

(c) You must not use an FRS unit in connection with any activity which is against federal, state or local law.

(d) You must, at all times and on all channels, give priority to emergency communication messages concerning the immediate safety of life or the immediate protection of property.

(e) No FRS unit may be interconnected to the public switched network.

FRS Rule 4 - FRS units.

(a) You may only use an FCC certified FRS unit. (You can identify an FCC certified FRS unit by the label placed on it by the manufacturer.)

(b) You must not make, or have made, any internal modification to an FRS unit. Any internal modification cancels the FCC certification and voids your authority to operate the unit in the FRS.

(c) You may not attach any antenna, power amplifier, or other apparatus to an FRS unit that has not been FCC certified as part of that FRS unit. There are no exceptions to this rule and attaching any such apparatus to a FRS unit cancels the FCC certification and voids everyone's authority to operate the unit in the FRS.

For complete information, see the Commission's Rules for the Family Radio Service, 47 C.F.R. 95.191-95.194.

For general information, please contact the FCC National Call Center toll free at 1-888-CALLFCC (1-888-225-5322) or e-mail callctr@fcc.gov. For specific information, please contact the Public Safety and Private Wireless Division of the Wireless Telecommunications Bureau at (202) 418-0680 or E-mail wtbinfo@fcc.gov.

Hello. I'm a relatively new homebrewer, so what I am about to describe may not sound as strange to you more experienced builders. I just finished constructing a homebrew "Pixie 2" transceiver. Upon powering it up, I get a very loud oscillation type sound. When I touch the leads of my '386 audio amp, the oscillations slow down to a series of clicks or stop altogether. I have checked and triple-checked my wiring and all looks fine. One possible source may be one of the three molded inductors. The literature that I received with my kit had many corrections as far as the color-coding on the inductors goes. I was thinking that maybe they made a mistake on the inductor values. The following is what they have listed:

L1- 22uH (red,red,black,silver)
L2-150uH(silver,brown,green,brown)
L3-2.2uH(silver,red,gold,red)

I realize that these inductors may not even be the source of the problem, but I thought they may have sent me the wrong values. Can anybody help me with this problem? Thanks.
Chuck

It sound like the audio amp is "motor boating" make sure that the out
put has a cap of about .01 uf cap (ceramic disc)inseries with a 10 ohm
resistor to ground. Also check that you have the powersupply bypased
with a large electrolitic cap in parallell with a .1 uf cap

How do you then apply the transparency to the
panel?

Source record: 65446

Gentlemen and Ladies

Im looking for the following information to restore a couple of Collins Rxs.

Does anyone have a parts layout, picture or whatever for the Lamb Noise Blanker used in the 75S1/3 series of Rx.

Also does anyone have any info on retuning or how to align the VFO used in the 75S1 my VFO is out by 15Khz over the 200Khz range

Interested in finding out information about the planetary plates layout for the 51J4, the idiot who rewelded the planetary plate did it out of wack and its completely wrecked the Rx on about 50% of the bands

Thank you in anticipation

Richard:

While I cannot assist you with your specific question, I can point you in the right direction to find help. Take a look at the following links. I can recommend the Collins Reflector. You may have to do a little detective work to find out how to subscribe, but it is well worth the effort. Try:

Listserver Subscription: listserv@listserv.tempe.gov - "subscribe collins 'name' 'call'"

Print on the non-adhesive side of the first label. Overlay a second adhesive page over the first. The second layer will prevent the first from being damaged after it is applied.

4292. FS: Variable Capacitors

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-21 00:00:00 UTC
From: n2ey@aol.com
Message-ID: <19991121132643.04792.00000111@ngol08.aol.com>
Source record: 65455

I have the following variable capacitors for sale. Shipping (from 19087) is not included. Prices shown are asking prices for single units - let's make a deal! Shipping weights are estimates - you pay only actual shipping charges,

Cardwell JP-48-GD - Split stator variable, 48 pF max. per section. 7 rotor and 6 stator plates per section, .070" spacing. Ceramic and micalex insulation, end plates are ceramic. 3" high, 2-1/4" wide, 6" deep, with 1/4" shaft extending 3/4" from one end. Used, good condition. Shipping weight 1 pound. Asking $5.

Cardwell 7103 - Single section variable, 150 pF max. 20 rotor and 19 stator plates, .070" spacing. Ceramic insulation, end plates are metal. 2-5/8" high, 2-1/2" wide, 6-1/2" deep, with 1/4" shaft extending 3/4" from one end. Have two identical units - one NOS in original box, one used, very good condition. Shipping weight 1 pound. Asking $9 for new one and $7 for used
one. $15 for both.

500 pF Cardwell transmitting variable - Single section variable, 500 pF max. 25
rotor and 24 stator plates, 1/32" spacing. Micalex insulation, end plates are metal. 2-1/8" high, 3" wide, 4-1/4" deep, with 1/4" shaft extending 5/8" from one end. Used, fair condition. Shipping weight 2 pounds. Asking $5

450 pF Hammarlund transmitting variable - Single section variable, 40-450 pF. 24
rotor and 23 stator plates, ,070" spacing. Ceramic insulation, end plates are metal. 3-1/4" high, 4-1/2" wide, 7" deep, with 1/4" shaft extending 1-1/2" from one end. Used, good condition. One of the four ceramic insulators that hold the stator is chipped, has no effect on operation. Shipping weight 3 pounds. Asking $12

The following 3 units are all similar in construction, but vary in details. All are high quality military surplus unit - beautiful construction, but manufacturer and source unknown.

3 gang precision receiver tuning capacitor - 3 sections, each with 7 rotor and 6 stator plates, each section approximately 10-65 pF. Rotor plates on ends of each section are slotted for tracking adjustment. Each unit is shielded from the others, and has its own independent rotor wiper and connection. Rotors are not electrically connected to frame. Rotor shaft is ceramic with metal sleeves, stator insulation is ceramic. Ball bearings, very smooth and low torque. 3" high, 2-1/4" wide, 3-1/4" deep, with 3/8" shaft extending 7/16" from one end. Shaft has metal sleeve on end. Used, very good condition. Shipping weight 2 pounds. Asking $4.

3 gang precision receiver tuning capacitor - 3 sections: Front and middle section each have 6 rotor and 5 stator plates, approximately 10-55 pF. Rear section has 7 rotor and 6 stator plates, approximately 10-65 pF. Rotor plates on ends of each section are slotted for tracking adjustment. Each unit is shielded from the others, and has its own independent rotor wiper and connection. Rotors are not electrically connected to frame. Rotor shaft is ceramic with metal sleeves, stator insulation is ceramic. Ball bearings, very smooth and low torque. Each section has integral air trimmer capacitor, 3 rotor and 3 stator plates, approximately 15 pF maximum capacity. 2-1/2" high, 2-3/4" wide, 3-1/2" deep, with 3/8" shaft extending 5/8" from one end. Shaft has metal sleeve on end, and 1-3/4" diameter brass gear (easily removed). Used, very good condition. Shipping weight 2 pounds. Asking $5.

3 gang precision receiver tuning capacitor - This unit is actually two capacitors bolted together and driven through a set of anti-backlash gears. One side has 2 sections, the other only one. All 3 sections have 9 rotor and 8 stator plates, approximately 12-90 pF. Rotor plates on ends of each section are slotted for tracking adjustment. Each unit is shielded from the others, and has its own independent rotor wiper and connection. Rotor shafts are ceramic with metal sleeves, stator insulation is ceramic. Rotors are not electrically connected to frame. Ball bearings, very smooth and low torque. Each section has NPO 3-12 pF ceramic trimmer, easily removed if not wanted. 2-1/4" high, 4-1/2" wide, 3-1/2" deep. Drive is via 3/16" idler shaft - brass gear doubles as shaft coupler. Used, very good condition. Shipping weight 2 pounds. Asking $5.

--

Big old 3 gang BC tuning capacitor - This is an ancient unit, origin unknown. Rugged heavy duty construction. Front and middle sections have 13 rotor and 12 stator plates, 20-450 pF. Rear section has 16 rotor and 15 stator plates, 20-500 pF. 2-3/4" high, 3-1/4" wide, 5" deep, with 1/4" shaft extending 1-1/2" from one end. Used, dirty and dusty, but tests good, bearings are smooth and can be cleaned up. Shipping weight 2 pounds. Asking 25 cents, or free with any order.

For a silk-screen kit, see:

http://www.cbridge.com/

They sell a complete photographic stencil making kit. Basic kit has
two 8x10 inch sheets of stencil material and everything needed to make
stencils as well as paints for about $30.

They are oriented toward selling to the crafts market, but the stencil
wouldn't know whether it was silk-screening a tee shirt or a radio
panel.

4295. Reading Electronic Schematics

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-21 00:00:00 UTC
From: J COWIE <cowietexas@worldnet.att.net>
Message-ID: <819sck$1ip$1@bgtnsc02.worldnet.att.net>
Source record: 65458

I am attempting to build a HF double tube receiver. However, I am not that skilled in reading electronic schematics. I have managed to make an interpretation pretaining as to what the parts are and a ROUGH analysis of where a few of the parts go. What I am requesting is an individual(s) that would consider looking over the "blueprint" that I have interpreted. The drawings that I have made could be faxed or perhaps e-mailed. Any help on this matter is held in high esteem.

Go to a crafts store or hobby shop and buy some spray on cement
that dries clear.

There is a guy on the internet at Almost All Digital Electronics ,
http://www.aade.com that has a process for making panel
faces. I've used it a couple of time and it looks pretty good.

Piece of cake. A quarter wave 2 meter antenna will work just fine at triple the frequency, right in the 70 cm band. SWR will be a bit higher but not that much.

If you want a fancier antenna, that may be a different story, depending on the details.

Thanks Jerry, the link worked fine for me as well. However the paints they sell are for fabric. I've asked them if they have a recommendation for paints for hard surfaces but no response as of yet. They do provide a kit less paint, so it looks promising once we settle the paint for hard surfaces issue :-)

4307. Radio Shack DMM w/PC interface?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-22 00:00:00 UTC
From: n2cqr@erols.com
Message-ID: <3838b710.128453097@news.erols.com>
Source record: 65465

Is anyone out there using the Radio Shack Digital Multimeter that has the computer interface? It is listed in the catalog at 59.95. The catalog says it can measure frequency and capacitance and transistor beta, but the one I looked at appeared to be only Volts, Amps and Ohms. Also, is it really autoranging?

Any reviews? Good piece of gear? Are there better alternatives? Any recommendations would be appreciated. The PC interface feature looks very useful. There is an article in the December 99 QST that describes how one guy used this feature to graph signal strength readouts over time...

I have a RS multimeter with PC interface. Mine is cat nr 22-168A. It
may be an earlier model than the current one.

Mine is not autoranging, but has capacitance and freq ranges, as well
as a transistor beta range and the conventional ohms+volts+amps.

Nice to be able to hook it to something and then monitor how it
changes overnight by looking at the data next morning.

Jerry W4UK.

4309. Where can I find plans for a Homebrew 6M SSB or 2M SSB Rig?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-22 00:00:00 UTC
From: a1@home.com
Message-ID: <383d9bdb.32561168@news>
Source record: 65467

Hi...where can I find plans for such a rig?
Preferably one with a digital readout, but that does not matter.

Also, a special type of antenna is required for SSB, isn't it? If so,
how could I build such an antenna out of either wire or pipes?

Even better would be if you could come up with a PCB for such a
thing...one that could be downloaded and printed out...but it is not
mandatory. PCB would be nice, however, because all my wire-wrapping
attempts are very sloppy.

TNX,
Rick

KE1JA@home.com
actually...it's rick1 instead of ke1ja. But, many spam checkers pick
up on e-mails in the body...so therefore i did that.

I have the 22-168A. It is not auto-ranging either, has a nice bargraph feature, records high and low, measures all of the above. It is pretty good, perhaps not quite as acurate as my Beckman DVM which I can reference to an HP DVM, not quite as acurate as my HP counter, but for the money I think it's a very useful tool. The errors are maybe one count.

They supply you with a disk and you can pretty much program the thing in Visual Basic - the code is all there.

The only problem with the device is that it eats batteries (not a very effective sleep mode, I guess.) but I buy 9 volts at Costco so it doesn't crimp the budget.

You should go to some length to make sure the audio oscillator is
a reasonably pure sine wave. A lot of the common audio oscillators
I've seen published are not sine wave oscillators and harmonic-rich.
Any distortion on your oscillator will show up on the transmitted
signal, limited only by the SSB transmit filter(s).

But make sure it's a nice clean sinewave. Unless it's pure, you
won't be generating CW, but something else.

If it is pure, it just gets translated through the balanced moudlator
to the IF frequency, and then up to the signal frequency through
the rest of the transmitter. Since it's a single tone, there will be
only one output frequency, and hence it's a CW signal.

Remember the old days when plug-in coil forms allowed band-changes?
Are those old forms, or something similar, available anywhere today?

thanks,
monty N5FC

4338. ## Repeat post: does anyone have access to a Mitsubishi RF catalog or similar other info source

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-23 00:00:00 UTC
From: tinkerman97@usa.net
Message-ID: <383a2594.4131954@ny.news.verio.net>
Source record: 65404
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design,sci.electronics.components

Hello Netfriends,

I'm repeating the post because although several tried to help no one
had the info and I still need the info...I'm quite sure that some RF
engineer here has a Mitsubishi RF manual around.
I need to get a data sheet for an RF synthesizer chip marked
"M64086GP". It might be discontinued, but I'm not sure.
It's the same chip used in the Radi Shack PRO-26 and Uniden BC-3000XLT
scanners.
Any info, data sheet or pointer to a web location would be great!
The Mitsubishi web site is useless. It has data on several similar
chips but not this one. They never responded to my emails.
Thank's for any help offered.

Thanks and best regards,
T-man

Note: when posting a Reply, please send me a copy
via email too so I don't miss any responses. Don't
forget to remove the "97" from my email address
inserted as an anti-spam counter measure...:-)

<maddog@io.com> wrote in message news:383a00de.216032560@news.io.com...
> Are SPICE models for vacuum tubes available anywhere online?

Yes. Check out the following URL's:

http://www.duncanamps.simplenet.com/spice.html
http://www.svetlana.com/docs/products/spicemodel.html
http://www.winternet.com/%7Ebiro/articles/VTspice.html

> Has anybody experience with modeling tubes in SPICE?

Yes. I did a custom spice model for a SV-811A power tube for RF amplifier use just to see if I could do it. The other models I have seen for the 811 are for low mu audio amplifier use. In general if you want good results you have to do a custom model. The generic triode models you see are OK as long as the tube curves fit the general look of the classic triode curve shape. In the case of the 811 the curves look more like a pentode.

The general procedure to design a model is as follows.

1. Select an equation which will generate a curve like the one on the tube data sheet. This is hard to do and requires a lot of cut-and-try cycles to find a good one that works well on ALL of the curves on the tube data sheet.

2. Very carefully measure 6 or more data point pairs. Collect more data points were
the curve is changing rapidly.

3. Use a spreadsheet (I use Mathcad) to fit the equation in step 1 to the data points
in step 2. This step is not so easy. I have found that I get a good fit over most of the curve except where the curvature is high. In this case it's a judgment call if the fit is good enough.

4. Repeat steps 1 to 3 for each curve on the data sheet.

5. Using the table source in spice you can output a voltage that is the exact value of ONE parameter in the equation used in step 1 based on the voltages or current at the tube elements. You will need to do this for each parameter in the equation in step 1.

6. Use the outputs from the table sources in step 5 in a function source to design a controlled current source connected between the tube's cathode and anode. Please consult a book on tube circuit design for details on equivalent plate circuit models to understand what I am doing.

7. The same procedure is used for the grid current.

8. Add in the interelectrode capacitors to match the tube data sheet values.

9. May need things like analog switches to stop the model from doing stupid things when the tube model electrode voltages are out of range etc.

So in general it's a lot of work! I spent 2 to 3 weeks screwing around trying to get my 811 model to work. I found the Anode_Cathode vs Anode current as a function of the Cathode_Grid voltage curves easy to work with. For the tubes that have only the constant current curves I use Mathcad to convert them to the other format.

When I used the 811 model in a grounded grid amplifier I got almost the exact same results for power and so on as listed on the data sheet for typical class B operation.

I've seen a couple of published designs using plug-in coil formers made
from plastic pipe glued to DIN plugs.

Enter
http://www.mot-sps.com/products/rf_and_if/frequency_synthesis/pll_synthe
sizers/mc145158.html#

Click on 'Documentation' and on 'MC145151-2/D'. You will get much more
than the pinout: the complete datasheet on many MOTOROLA synthesizers
IC's. But you MUST have Adobe Acroread to read the .pdf file.

Well, the correct name is Loctal instead of Locktal, but if you want 8
pins type, you will find them with Ocean State Electronics at
http://www.oselectronics.com/ose_p84.htm
See them on the sockets window.

>

There are several.
For example:
From Philips: TDA1072A, TDA1572, TEA5551 and TEA6200
From Ferranti: ZN416

I would suggest the Oak Hills research 100. I have 1 of these 40 meter rigs and it does me an outstanding job on a homebrew dipole. Theere is an internet site for purchase... just search it out.

"A 400 W Power Amplifier for 145 MHz Equipped with the 4CX250"
J. Kestler DK1OF, VHF Communications, 2/1978.

The index is on line at http://www.vhfcomm.co.uk (that's how
I found the article). Mike has lots of back issues available.

I would think their paints would work fine for labels, but I believe
you can squeegee any paint you want, once you have prepared the
stencil. In the instructions, they talk about using other things, like
acid to etch glass, etc.

Jerry W4UK (bought their stuff for tee-shirts, but haven't used it
yet).

BTW - Steve Jackson emailed me the following URL, which shows another
label system:

http://www.mich.com/~bjlavoie/decals.html

They advertise "Affordable Custom Made Decals For Your Electronic
Projects"

Intusoft Vacuum Tube Models
Date: 2/98

Copyright © Intusoft 1998
Tel (310) 833-0710
Fax (310) 833-9658
e-mail: info@intusoft.com
World Wide Web site: http://www.intusoft.com

These models are part of the ICAP/4Windows Deluxe package which
currently
includes over 10,000 models and hundreds of different part types. With
regard to the number of part types, it is the largest library available
from ANY SPICE vendor!!

****
* Tube Subcircuit Application Notes
* For more info see the Intusoft Newsletter #18 August 1990, Newsletter
#34, Feb. 1994
* and Newsletter #35 April 1994.
*
****

SPICE Simulation Models
These SPICE simulation models may be used and distributed freely,
provided they are not altered in any way, resold, or included in
any other package for resale. In addition, the Intusoft copyright
notice MUST be maintained and included with any model distribution.

As a service to our customers, we provide a free modeling service.
If you are interested in obtaining additional models, please contact
Intusoft technical support.

ICAP/4 Windows Demonstration Software
The demonstration version of ICAP/4 Windows including IsSpice4 may be
downloaded from our Web site at no charge.
Also available for download are additional models, product and
ordering information, technical articles, and Intusoft Newsletters.

SpiceMod Modeling Software
SpiceMod is a CAE program that is used to create SPICE models from
data sheet values. SPICEMOD is particularly useful in the circuit
design phase because it allows the designer to create SPICE models
based on electrical specifications before an actual device is selected.
SpiceMod may be used to create models for diodes, Zener diodes, BJTs,
power BJTs, Darlington BJTs, JFETs, MOSFETs, power MOSFETs, IGBTs,
SCRs, and TRIACS.

****
Macromodels, simulation models, or other models provided by
Intusoft, directly or indirectly, are not warranted by
Intusoft as fully representing all of the specifications and
operating characteristics of the semiconductor product to
which the model relates. Moreover, these models are
furnished on an "as is" basis without support or warranty of
any kind, either expressed or implied, regarding the use
thereof and Intusoft specifically disclaims all implied
warranties of merchantability and fitness of the models for
any purpose. Intusoft does not assume any liability arising
out of the application or use of the models including
infringement of patents and copyrights nor does Intusoft
convey any license under its patents and copyrights or the
rights of others. Intusoft reserves the right to make
changes without notice to any model.

Although the use of macromodels can be a useful tool in evaluating
device performance in various applications, they cannot
model exact device performance under all conditions, nor are
they intended to replace breadboarding for final
verification.

These models are part of the ICAP/4Windows Deluxe package which currently
includes over 10,000 models and hundreds of different part types. With
regard to the number of part types, it is the largest library available
from ANY SPICE vendor!!

SPICE Simulation Models
These SPICE simulation models may be used and distributed freely,
provided they are not altered in any way, resold, or included in
any other package for resale. In addition, the Intusoft copyright
notice MUST be maintained and included with any model distribution.

As a service to our customers, we provide a free modeling service.
If you are interested in obtaining additional models, please contact
Intusoft technical support.

ICAP/4 Windows Demonstration Software
The demonstration version of ICAP/4 Windows including IsSpice4 may be
```

downloaded from our Web site at no charge.
Also available for download are additional models, product and
ordering information, technical articles, and Intusoft Newsletters.

SpiceMod Modeling Software
SpiceMod is a CAE program that is used to create SPICE models from
data sheet values. SPICEMOD is particularly useful in the circuit
design phase because it allows the designer to create SPICE models
based on electrical specifications before an actual device is selected.
SpiceMod may be used to create models for diodes, Zener diodes, BJTs,
power BJTs, Darlington BJTs, JFETs, MOSFETs, power MOSFETs, IGBTs,
SCRs, and TRIACS.

****
Macromodels, simulation models, or other models provided by
Intusoft, directly or indirectly, are not warranted by
Intusoft as fully representing all of the specifications and
operating characteristics of the semiconductor product to
which the model relates. Moreover, these models are
furnished on an "as is" basis without support or warranty of
any kind, either expressed or implied, regarding the use
thereof and Intusoft specifically disclaims all implied
warranties of merchantability and fitness of the models for
any purpose. Intusoft does not assume any liability arising
out of the application or use of the models including
infringement of patents and copyrights nor does Intusoft
convey any license under its patents and copyrights or the
rights of others. Intusoft reserves the right to make
changes without notice to any model.

Although the use of macromodels can be a useful tool in evaluating
device performance in various applications, they cannot
model exact device performance under all conditions, nor are
they intended to replace breadboarding for final
verification.

4352. FS: MMICS, RF comps. revised (long)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-23 00:00:00 UTC
From: Brad Thompson <Brad_Thompson@pop.valley.net>
Message-ID: <383AC8C6.403D@pop.valley.net>
Source record: 65418

Hello-- Revised 11/23/99

I'm offering homebrew builders oddball, offbeat and hard-to-find NOS RF components, including...
***
Hewlett-Packard MSA-0786 MMICs ($1.00 each, $5.00 for 6, $10.00 for 15, or $25.00 for 50 pieces); DC-2 GHz. These are taped and reeled and have leads configured for surface-mounted applications. Specs are available at...
http://www.hp.com/HP-COMP/index.html
***
1N5711 Schottky diodes, full-length leads, taped and reeled, $1.00 for 10
pieces
***
1N5821 Schottky rectifiers, full-length leads, bulk packed, $1.00 for 8 pieces
***
PIN diodes, no other specs available; full-length axial-leaded packages; individually serialized in sealed-foil envelopes. $1.00 each.
***
JAN 1N748A Zener diodes: individually sealed in mil-spec foil packets for your protection<g> in 1983.
$1.00 for 6 pieces.
***
Minicircuits T4-1 (4:1 ratio) broadband RF transformers-- $1.00 for 3; DIP-packaged. Visit www.minicircuits.com for full specs via their catalog.
***
Minicircuits PSCQ-2-400 90-degree, 2-way power divider, 0.9 dB insertion loss, 225-400 MHz; $1.00 each
***
Fair-Rite cores (both type 43 mix):

2643023002 (a long-cored toroid) $1.00 for 10 pieces
2843002402 (binocular (balun) core) $1.00 for 20 pieces
***
Coilcraft p/n 142-07J08 single-winding adjustable inductors.
330 nH min./ 378 nH nom. /427 nH max.; 307 nH with tuning slug removed. Q is 112 min. at 40 MHz; 7.5 turn winding on 10 mm molded form.

$1.00 for 5 pieces; $5.00 for 35 pieces.
***
SD-201 Signetics DC-2 GHz DMOS single-gate FETs four-lead TO-72 can

(like TO-18 w/shield lead). A conductive-rubber antistatic "O" ring
encircles
all four leads. Specs (available on request and with purchase) include
S parameter plots. $1.00 each, $3.00 for 6, $5.00 for 12 pieces.
***
TN-2219A National Semiconductor NPN general-purpose NPN transistor:
100 < hFE < 300 at Ic= 150 mA; BVcbo = 75 V min.; BVceo = 40 V min.;
Icbo = 10 nA max. at Vcb= 60 V; Cob = 8 pf max.; Ft = 60 MHz min.
at Ic = 20 mA. NF 4 dB (max.)
In TO-237 metal-tabbed plastic package (similar to TO-92); this package
reduces thermal resistance from 125 C per watt for a TO-92 to 50 C per
watt for the TO-237.
Ideal for building a QRP rig around a single device!
$1.00 for 20 pieces; $5.00 for 120 pieces
***
SAW-stabilized oscillators; intended for ECL circuits, but also
reportedly usable as LOs. All are packaged in metal DIP cans.
$4.00 each, or three assorted for $10.00

Frequencies available are:
222.222 MHz (RF Monolithics HC1279; proprietary p/n marking)
350.000 MHZ (RF Monolithics HC1301)
366.667 MHz
400.000 MHz ($2.00 ea. but not NOS; removed from PC boards)
733.333 MHz
***
Also, I have Teflon- and diallyl-pthalate insulated single-point turret
lugs at $12.00 per 100 (many styles available-- e-mail a request for
information and a jpg image showing various types).
***
Feedthrough capacitors: Spectrum Control 100 pf nominal (threaded
bushing mount, hardware included). Attenuation is specified as
-10 dB at 300 MHz, and -20 dB at 1 GHz.
$.50 each, $1.00 for 3 pieces.
***
Trimmer capacitors(USED and ABUSED): Johanson upright PC mount, 2-15 pf
multiturn piston capacitor. A drop of brown Glyptal varnish secures each
capacitor's adjustment screw. A dab of Zip-Strip (a methylene chloride-
based paint remover available in hardware stores) softens the Glyptal,
allowing readjustment. Some solder residue is present on terminals,
and on some trimmers a through-hole solder tab may be missing. Price:
$1.00 for 10 pieces; $2.00 for 25 pieces
***
Air-variable capacitors manufactured by Cardwell (their part no.
PL6348).
NOS surplus, m'fd. sometime in the 1950s.
--Configuration: consists of two plates separated by 0.1";
--Estimated capacitance range: 1-5 pf.
The adjustment shaft is 0.25" dia. by 0.5 inches long; bushing or
isolated mounting; easily disassembled for capacitance vs. frequency

modification, etc. A more-detailed description is available on request.

Price: $3.00 each, $10.00 for 5 pieces, $20.00 for 12 pieces.
***
Caddock MS281N NONINDUCTIVE resistors:

10 ohm +/- 5 per cent tolerance, 8 watt noninductive power film resistors
Tinned axial leads (0.75 inches long) are formed for PC-board insertion on 1.2-inch centers. These are NOS, bulk-packed parts.
Note: these measure well within tolerance at +/- 0.2 ohms typical. Full specs are available in PDF format on Caddock's web site (www.caddock.com)
but highlights are:
--Temperature coefficient of resistance: 50 ppm;
--Power rating: 8 watts at 25 C, derating to 4 watts at 150 C and 0 watts at 275 C;
--Noninductive design: serpentine film layout cancels magnetic field-equivalent inductance of a straight piece of wire of the resistor's body plus lead length.

Applications include:
--Current sampling;
--Cathode bias;
--Dummy loads for audio and RF applications.

Price: $1.00 each ($10.00 for 12 pieces); only 70 pieces available
****
Six-lug terminal strips, like Keystone p/n 825: six isolated, tinned steel lugs mounted on a brown phenolic insulating strip, arranged in groups of three on either side of a central mounting bracket. There's no center grounding lug, but you can add a jumper to an adjacent lug or two as required. Tie-point strips work well for breadboarding if you use unetched-copper PC board laminate as a ground plane.

The lugs are spaced on 0.375-inch centers; mounting bracket has a 0.140-inch hole (use a 6-32 screw for chassis mounting).

I've sold thousands of these, but my supply is running low. Buy a batch now before they all go to good homes<g>. ***DEFINITELY THE LAST CALL! ONLY A FEW HUNDRED REMAIN***

Prices: $.15 each, or $6.00 per 50 pieces, $10.00 per 100 pieces.

****
* NOS Warranty policy *
****
Scanned images or digital photos of components are available on request.

If you purchase NOS tubes or components and find them unsatisfactory upon your inspection, notify me within seven days and return items in as-received condition for a full refund or replacement (if available).

This material is subject to prior sale and is supplied as-is, as
new-old-stock (NOS) merchandise, with all responsibility for safe and
successful application residing solely with the purchaser.

If you're searching for oddball components of any vintage, don't
hesitate to inquire about availability.

Hello Everyone,

I'm selling my Lowe HF-225 fitted with the following options,

D-225 FM detector/ AM sync board.
W-225 Antenna pre-amp and telescopic whip antenna.
K-225 Remote data entry keypad.
B-225 Internal NiCad battery pack.

Complete with power supply and handbook, all in mint condition.
£225 to include UK delivery.

Please reply direct to john@mm1dsp.freeserve.co.uk

Many thanks and all the very best.
John.

Hi,

I have a version of the emtech nw40. The output transistor has blown
and I have
lost the schematic. Does anybody out there have a schematic of this
rig and can they give me the part number of the output transistor.

This would be a big help

Please post the reply to this forum or send it to

Hi. I am searching for a replacement speaker for my 207. It is 2" (5cm) in diameter and has a VERY flat magnet structure on the back of the speaker basket and is 8 ohm .5 watt. Do you know where I can get one or do you have one? I would like to get a nos or new equiv. as most of the used ones out there will be damaged or overdriven. Help!

Thanks,
Randy KB8ASO

Issue 2 1978. I have a copy infront of me now (in English)

Looking at the diagrams and photos, I hope you've got good
engineering facilities :-)

I would guess that it is out of print by now and the publishers
would not object to me making a copy.

14 A5 sides = 7 A4 copies.

(I've checked later issues for any errors/corrections/modifications
to the article, but there don't seem to be any)

Email me if you would like me to copy it for you.

Regards

Barry

with NE604/614 (MC1351P, SN76660N or similar) as AM detector you only
need few millivolts IF output, might save 40-50dB IF gain and have
much improved audio quality, even for faded signals

The Signetics TDA-1072 or the TDA-1572 are great chips. These devices have on board AGC and demodulation. I use only the IF and demod portions of these chips; there is no problem using them with a '602. You can run the 602 directly into a ceramic filter such as a Murata CFWS-455H, and them into the IF input of the Signetics chips. I have used these devices in my latest radio designs, and they are good performers. The main difference between the TDA-1072 and the TDA-1572 is that the 1572 has a buffered 50 ohm IF output, suitable for driving a product detector. If you use an NE-602 as a product detector, a series R of 24K is about right. If anybody has any questions about these chips, feel free to give me a shout.

Radio Shack used to sell 1N34 germanium diodes in a "10-for-$1.98"
blister pack. You might have a look in their catalog or web site.

My VHF/UHF dx books shows K2RIW amplifier, believe the main difference
to other designs for DK1OF type is the coupling capacitor at anode
side, perhaps some difficulties in obtaining this capacitor? Please
advice me if I am wrong.

From: Roger Leone <arleone@inreach.com>
Message-ID: <d_3%3.97$lK1.5041@news.inreach.com>
Source record: 65352

For sale:

Resistance decade unit, model RDS-100-RT...made by General Resistance, Inc.
This is part of a larger unit...it is only the "tens" part of a decade box.
It has an 11 position rotary switch for 0 - 100 ohms in 10 ohm steps. 250
ma
current max. Manufacturer claims .04% accuracy. My meter is not that
accurate,
but agrees with this unit.

It is mounted in a cylindrical aluminum enclosure, which can be opened by
removing
2 screws. It is about 3" in diameter and 3" long. The switch has a standard
1/4"
shaft coming out the front. Includes knob, mounting hardware, dial plate
and
instruction sheet for mounting. The instruction sheet has a line drawing of
the unit...I can e-mail it if you would like to see it.

This unit is new, sealed in foil lined envelope. Manufactured in 1988.

Original cost to us (U.S.) was $365.00 each. I have 30 of them for sale for
$5.00 each. Shipping extra--estimate about $3.00 for one. Discounts
available
for quantity purchases. Let me know if you would like more than one and I
will
quote a price.

Please respond to my e-mail address: arleone@inreach.com

Thanks

Roger K6XQ

4377. 1N295 Substitutes?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-24 00:00:00 UTC
From: jimvalin@aol.com
Message-ID: <19991124115706.01854.00001494@ng-cd1.aol.com>
Source record: 65433

A very simple question I know, but....

I've got a Heath HM-102 SWR Meter which does not function. In testing various components, I find that two of the 1N295 diodes on the board are fully conductive in both directions (not a good sign for a diode).

My question is, what is available to substitute for this obsolete diode (I don't have a substitution reference and the 1N295 is not listed in any of my catalogs). I presume the replacement costs all of 3-5 cents but, I need to know what to order.

73s de K4ZDZ

(Licensed back when converting ARC-5s and ART-13s was the thing to do. Unfortunately, I've been away from actually repairing equipment for about 35 years).

I had a homebrew fanatic lab teacher in EE school that used to make
his panels from a Formica-like laminate and lettered them with a
Leroy set, then protected the ink with clear Krylon. Looked great.

How many of you know what the Leroy lettering system was? Am I
dating myself? You old engineers and draftspeople can check out:

Why do not use the exact original diode?
Try Kenselectronics at http://www.kenselectronics.com/lists/orig.htm
or Derf Electronics at http://www.derf-intl.com/electronics/32.html
They have it in stock.

No the difference is in the anode tuning capacitor (maybe you mean
that?) - In the W1SL its a flapper arrangement - the VHF/UHF DX book has
the updated design with altered dimensions. Its from the house of GW4FRX
so its pretty safe. The PSU details in the book are also very useful and
very pertinent, plenty of good tips on choosing transformers, capacitors
etc.

4394. Mini Din plugs

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-25 00:00:00 UTC
From: jwodell@ameritech.net
Message-ID: <38402838.1472044@news.detroit.mi.ameritech.net>
Source record: 65360

Anyone know how to solder to MINI DIN plugs?

Confounded things are plastic that melts at about 120
degrees, with solder cups. Think they make a crimp
version, which is the way to go, I think.

Also, I wasted about a week, cause someone told me
the were the same series as a PS/2 connector. Nope.

Adding a simple buffer amp followed by an 8-stage binary divider would produce accurate 50 KHz markers for a QRP (or other rig). Picking off the output of the 5th, 6th and 7th stages would provide markers of 400, 200, and 100 KHz spacing respectively.

There is a good buy in the surplus market by ALL ELECTRONICS, in Los Angeles 1-800-826-5432 On page two of the catalog two 127 junction devices are listed, one just the Peltier junction for $17 and the other the same device mounted on a heat sink for $26. Both operated from 12 VDC at six amps. These maybe more than you need as they seem to be removed from portable cooler boxes. 73 Cliff K7RR

4403. Plate transformer

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-25 00:00:00 UTC
From: Bob <balbert@cnmnetwork.com>
Message-ID: <Vhf%3.2200$zQ4.174193@news2.giganews.com>
Source record: 65369

I have a nice hermetically sealed military plate transformer for sale.

Primary 115 VAC 60 Hz.
Secondary 3100 VCT 500 mA DC.

This unit should run cool at continuous full load, probably will put out
more current than rated if duty cycle is low.

This one is heavy, pickup only in Los Angeles.

4404. Where can I find plans for a Homebrew 6M SSB or 2M SSB Rig?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-25 00:00:00 UTC
From: a1@home.com
Message-ID: <384383d1.71795462@news>
Source record: 65370

Hi...where can I find plans for such a rig?
Preferably one with a digital readout, but that does not matter.

Also, a special type of antenna is required for SSB, isn't it? If so,
how could I build such an antenna out of either wire or pipes?

Even better would be if you could come up with a PCB for such a
thing...one that could be downloaded and printed out...but it is not
mandatory. PCB would be nice, however, because all my wire-wrapping
attempts are very sloppy.

TNX,
Rick

KE1JA@home.com
actually...it's rick1 instead of ke1ja. But, many spam checkers pick
up on e-mails in the body...so therefore i did that.

But just as there are DIN plugs with different numbers of pins, there are Mini-Din plugs with different numbers of pins. It was my impression that the PS/2 used them on mouse connectors, and perhaps something else. They are also used for the serial ports on Macs (maybe not the recent ones, but definitely on not the most recent Macs); these have 8 pins. The Mac's ADB bus for keyboards and mouses, use Mini-Din with 4 pins. I've seen cables using other types of Mini-Din plugs at the local surplus store; I don't know what they are used for, though perhaps they are the same as used in the PS/2. These are some I know of, and I have to assume there are others.

I did solder to one of those plugs from the surplus store. I don't recall any problem, though I can't remember the specifics.

But the trick is probably to find a match for whatever connector you need, and buy a cable for it. Cut off whatever is at the other end, and you have a moulded plug with a cable attached. Off hand, I wouldn't know where to buy Mini-Din plugs, so that's why I'd choose that route. Of course, sometimes not all the pins have wire connected to them, which might be a problem in some cases.

The ECG replacement guide says it crosses to the ECG 110A, which is a
germanium general purpose diode, 40V max PRV, Average rectified forward
current (Io Max) of 50mA, and Forward current repetitive peak (Ifrm) of
150mA.

The 1N34, which of course tends to be used to describe a general purpose
small signal germanium diode, crosses to the ECG 109, which has 100V PRV
and 200 mA for theIo Max, with no figure given for the Ifrm.

An old Motorola databook says about the same thing for the 1N295.
I think it shows the 1N34 isn't quite as good as the 1N295, though
the chart isn't quite the same for each device.

I'mnot sure the problem will be finding a replacement, but finding
a germanium diode. I'd say that's one of the key things to look for,
with current rating being important once you find some germanium diodes.
What's available will be limited. The Motorola book has plenty of
germanium diodes listed (of course, the book is about 25 years old),
but there's no sense listing them if they aren't available.

Look for older equipment, and search for germanium diodes. They have
a lower voltage drop. I certainly can tell them apart from silicon
with my DMM.

If you can find some germaniums, then you can loiok them up.

> What can I do? It's frustrating.

The most frustrating thing about it is that consumer gear of all types is
made to be cheap and not complete. For example, look at the FCC statement
for your cordless phones and you'll see an FCC requirement that "This
device must accept any interference received, including interference that
may cause undesired operation."

Are you sure this is a *ham* operator? Please post his callsign.

Provided his equipment is working properly and within its legal limits,
and if this is a ham there's a better-than-even chance of that, about
all you can do is chase the problems individually, doing whatever it
takes to make each device reject the interference the way it should have
been (but wasn't) designed to do.

Talk to the ham. He can either place low pass filters in his transmit
path, or give you highpass filters for your equipment.
If the guy is a legitimate ham, as opposed to an illegal CB operator, he
should be responsive to your problem. But if he is doing everything
legal, I agree with another poster that states consumer equipment is
susceptible to this interference due to poor design.

As a side note, I have a friend 2 doors down who is also a ham, and he
constantly complains to the cable company that his transmissions and my
transmissions interfere with his tv reception.

Colin,
I apologize to you for assuming that this person could have been an
illegal CB operator. My thought process went that way because
I believe that the transmit level is much lower with CB stations, and should
not interfere with neighbor's equipment.
Perhaps you can describe if you have had any local EMI problems
with your neighbors regarding CB vs. HF transmissions.
Even though I have cable tv, my CW overloads the tv sets in my house.
So just like a smoker, I do it on the prowl, when the family is asleep.

>I have heard about 25 Hz transformers, what were they used for?

>There were other frequencies than 50 and 60 for power distribution
>in recent times?

The first hydroelectric generating stations at Niagara Falls operated at 25 Hz. I don't know why that speed was chosen - possibly because it allowed the alternators to be wound with fewer poles or to rotate more slowly.

Unfortunately, 25 Hz transformers require a great deal of iron in their core for their size. Lighting operated from 25 Hz power flickers at 50 Hz, which is visible. At some point, most of the generating capacity there was changed from 25 to 60 Hz.

My parents lived near Niagara Falls all their life, and my father remembers a point at which the change happened. Transformers didn't need changing; a transformer built for 25 Hz operation is simply over-built for 60 Hz. Resistive loads (including incandescent lamps) were fine. But any appliance using an induction or synchronous motor was brought in to the local electrical authority for modification or replacement.

I believe that there were some heavy industries near the falls that never changed over , and one generating station continued to operate at 25 Hz for decades afterwards, perhaps right up to the present.

Dave

In the earlier days of pwr. distrn., 25 Hz (cps) was used in some
smaller systems; as I recall primarily in the SW portion of the
US, and also in some parts of Asia. FWIW, DC was also used for
local distrn. very early on.. See Ref. Data for Radio Engineers,
2nd (?) Ed. , for some tables.

An impressive quad! Prop pitch motors come in small, medium, and large
sizes with the large being about 12 inches or so across. Sizing will be a
factor when mounting on/in a tower.

to all CK-722'ers,

I just found my book:

"Raytheon Transistor Applications - More the 50 Practical Circuits
using Raytheon CK722 Transistors. Complete How-To-Do-It Instructions."
Some of these projects are ham radio related. 120 pages including
the covers, 11" x 8-1/2". The receipt with it shows it was purchased on
Feb 20, 1956. My guess is - 1955 printing. I do not see any copyrights
in it.

If there is sufficent interest, I'll find out how much Kinko's will
charge to reproduce it (if they will.)

Monty,

I have used the phenolic bases from defunct vacumn tubes. I carefully crush the glass
and remove the innards...watch out for broken glass. I unsolder the leads from
the base pins and have an 8 pin coil form ready to go.

Make sure you don't perfrom this operation on tubes which contain radioactive
elements such as voltage regulators, or mercury vapor rectifiers.

The height of the form is about 1 inch. If you need a taller form insert a plastic
pill bottle into the base.

Old tubes and the sockets are available at flea markets for a fair price.
Usually, I find them in a bix of junk that the buyrt does not want to drag home.

I like this method because it is in the spirit of homebrewing...you
roll your own and the price is right.

How about:

Find a matching socket. Put the plug (minus the backshell halves) into it - to provide support. Pre tin the wires & the plug (quickly). Solder quickly. Don't be tempted to fix it if it looks a bit rough.

If the finished job isn't to your liking, cut it off & try again with a new plug ;-)

Yes that works well. Also, a very low wattage iron with a tiny tip helps. I use a 15W pencil iron.

You can't, because people rarely build such things in the way you
describe. And it doesn't matter how many times you ask.

A nice building block approach would build on work published
by KK7B in QST and reprinted in QRP Power, with kits available
through Kanga US. But it's not a turn-key approach, by any
means. You will actually (gasp!) have to do some work.

Wire-wrap? For RF circuits?

Some of the other replies seemed to me to indicate that the ham radio operator WILL help you to fix the problem. I just want to make it clear that he is under no obligation to do so. Most ham operators will help in the interests of peace and goodwill to all neighbours, but I have been in the situation where there was no indication of a complaint from a neighbour, just a sudden threat of eviction by estate owners! I called in the telecomminication authorities and a lawyer. It went quiet after that, and the neighbour was charged with connecting an unauthorised telephone to the network.

Hi all,
I'm looking for some info on the radio mentioned in the subject line. It seems that the second of the two front panel illumination lights has expired and I need replacements. Can anyone tell me where to find a couple of these critters? I'm not sure of the type (LEDS?) or voltage etc. because I also have no service manual. 8^)
Any help appreciated.

4436. Re: How does R/C network act as filter? (Audio Amp. question)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-26 00:00:00 UTC
From: Allan Henry Kaplan <w1ael@mindspring.com>
Message-ID: <383EAF7D.62721CB6@mindspring.com>
Source record: 65390

The voltage divider formed by the 220K and 10K resistors divides the high voltage down by a factor of 22 with a source resistance equal to the parallel combination of the resistors, about 9.5K. This Thevenin-equivalent resistor acts with the capacitor to form a low-pass RC filter. The formula 1/(2*pi*R*C) gives a 3 dB corner frequency of 16.6 KHz (IF I did the arithmetic properly). I hope this helps. 73 de Allan, W1AEL

I need to replace a pin diode - KS4522 or M1308 from a Ten_Tec
transverter kit. However, I cannot find the specified diode in the UK.
Does anyone know of a suitable replacement?

The pin diode is part of the receive pre amp stage, protecting the pre
amp from the transverter output. During transmit the diode is biased
on and shorts the input of the pre amp to ground.

Any help would be greatly appreciated.

From: Bob <balbert@cnmnetwork.com>
Message-ID: <VAU%3.4587$zQ4.366842@news2.giganews.com>
Source record: 65319

Try a 100 Watt light bulb. Works great as dummy load in the 50 Watt range. For higher powers, put a couple in series or parallel. Important that the bulb not light brightly, since a brightly lit 100 Watt lamp (120 Volt variety) is 161 Ohms or so.

For more precise values, adjust the supply to the lamp and measure the current. When you find the resistance you like, match the brightness and you will have the right value. They are not inductive, cheap, and work up into the VHF range.

If that isn't your cup of tea, I suggest a bank of two-Watt carbon resistors. Fifty of them in parallel, 2.7k Ohms will give you 54 Ohms and will handle 100 Watts for long periods if you don't pack them too closely. Works into VHF range. For better high frequency performance, use two banks in series of 25 resistors in parallel, each resistor 620 Ohms. That should give 51.2 Ohms.

You can use wide tolerance resistors; in general, the typical bell shaped tolerance curve of so many resistors will average out to an amazingly accurate result.

I have used a series string of five two watt resistors, 10 Ohms each, as a dummy load for many years without problem. It would handle around 10 Watts continuously but I've put a lot more into them for short periods. No sign of overheating, and I can monitor them easily with a fingertip.

If you only want to use it below 30MHz you do not need to look for low reactance resistors, you can paralell many lower wattage carbon resistors. If you wish to build it for higher than 30MHz the problem with parallelling resistors is inductance in the connections between the resistors, this has a physical extension for good cooling, and also some capacitive effect.

I used some non-inductive 200 ohm resistors (50W) from RCA TV transmitter on 200MHz, resistor size 2" diameter tubular, 4" long, they were good alone, but connected in parallell capacitance and inductance of the leads is a problem, so it is still not much good on 50MHz-up. For a single-band VHF operation a far better approach is a single resistor with impedance transformer, but still - the physical length of resistor has some inductance.

In a dummy load you can probably use resistors rated for the sum of 250W on 1kW if you do not intend to tune for minutes. Problem is that coax cable may melt before resistors are damaged. With a simple fan this is very much improved.

For lower power levels it is easy to use 6 standard 2W 300 ohm resistors in paralell to build a dummy with as much as 12dB reflection loss on 1296MHz., and better on the lower bands.

Electric railroads used DC and/or 25 Hz. In some locations
the first user of electricity was the railroad. People living
in those locations could sometimes get power from the railroad
system. Also industry used these DC or 25 Hz systems. DC or low
frequency has lower trasmission losses if I remember correctly.
Today there are DC transmission lines. An example is a line from
Oregon to Southern California.

>Lighting operated from 25 Hz power
>flickers at 50 Hz, which is visible.

A flicker rate of 50 Hz is commonly spoken of as being annoying, but it is well above that of modern theater projectors, which I believe run at 16 frames/sec, projecting each frame twice for a flicker rate of 32/sec. I haven't run into anyone yet who is annoyed by the flicker rate of a modern movie.

In addition, incandescent bulbs have enough thermal mass that they really don't cool down that much each cycle, so there really isn't much flicker to them.

Of course, neon and fluorescent lamps DO flicker at twice the line frequency.

I suspect that the move to higher line frequencies was motivated by the reduction in iron (and consequently weight and size) in generators and transformers.

Message-ID: <0ZW%3.254$Jh3.4016@jump.innerx.net>
Source record: 65328

Good news - There is no difference in the antennas. RF is RF, regardless of how it's modulated.
Bad news - no schematics or plans for a complete integrated rig, sorry. But, if you're willing to do some research and design work, the RSGB VHF/UHF manual, as well as the ARRL handbook both have plans for all the building blocks to build what you're looking for. "All" you have to do is to integrate them.

Actually, the first thing is for you to figure out exactly what you want. Does it have to be a complete, integrated transceiver, or would separate transmitters and receivers be good enough? Do you want to build the whole thing from scratch, or could you pick up a good used HF rig (even an old tube-type boat anchor) and build just a transverter for it? There are definitely plans for those in the Handbook. For the receiver, how about picking off the signal from a handheld just after the mixer and running it into a full coverage HF receiver? You get CW, USB, LSB, FM and maybe AM in one setup that way. The HF rig would be left on the IF and all tuning done with the handheld, so you could use an old BA with an analogue dial and still have digital readout from the handheld. And, no wire-wrapping needed at all.

And speaking of wire-wrapping, probably not such a good idea for analogue VHF. You can get away with it for digital, especially CMOS, and I know a professional RF engineer who even uses wire-wrap wire and those white plug-in proto boards to breadboard circuits for up to 1 GHz. But he knows what to expect and how to compensate for it. We mere mortals should not tempt Murphy by doing that kind of silliness.

For more info, check out the 2 books I mentioned. Other sources for building blocks are the Satellite Experimenter's Handbook by Martin Davidoff, K2UBC (that's where I got the handheld idea from), pretty much anything by Doug Demaw, W1FB (his Solid State Design for the Radio Amateur - co-written with Wes Hayward, W7ZOI - actually has a DSB 2 & 6 meter transmitter, as well as a universal SSB exciter that can be one of your building blocks and construction techniques much more appropriate than wire-wrap) and for on-line info about building blocks (as well as a 2-meter crystal set), Harry's Homebrew Page (Harry being SM0VPO) at http://sm0vpo.8m.com/ . Good luck.

>of 32/sec. I haven't run into anyone yet who is annoyed by the flicker
>rate of a modern movie.

16 and 18 FPS were used for movies in the silent period, but sound
movies run at a standardized 24 FPS. With the usual double-flash
projector, this results in a 48 Hz on-screen flash rate. The eye's
sensitivity to flicker depends on lighting levels, and at the relatively
low light levels in movie theatres within the image areas, 48 Hz flicker
is *usually* not visible.

However, the eye is more sensitive to flicker in its peripheral vision
than it is in the central area (fovea), and movies sometimes have
large areas. that are significantly brighter than the
average image level. When all of these factors combine, for example
if there are bright clouds in the sky but you're looking at something in
the foreground, audiences sometimes *do* see flicker in standard movies.

To avoid this, triple-flash movie projectors have been built; the 72 Hz
flash rate *is* invisible regardless of scene content.

Computer displays are much brighter than movie screens, so they
have to be operated at higher frequencies to avoid flicker - as high
as 72 Hz in some cases. 48 Hz flicker on a CRT is definitely visible
at normal room light levels.

Now, light bulbs are even brighter than CRT displays, and are also
more often in the peripheral vision, so this is probably the worst
possible case for seeing flicker.

>In addition, incandescent bulbs have enough thermal mass that they
>really don't cool down that much each cycle, so there really isn't
>much flicker to them.

Have you ever seen a light bulb driven by 25 Hz? I haven't myself,
but I have heard of the flicker.

In addition, I've measured the flicker produced by a 200 W 12 V halogen
lamp running from 60 Hz. This is a nice heavy tungsten filament, and
the ripple in the light output is still a few percent - not enough to

see flicker, but enough to screw up a CCD scanner. So I'll readily believe that a thin 120V filament running at 25 Hz would have much more ripple in light output, enough to see.

>I suspect that the move to higher line frequencies was motivated by
>the reduction in iron (and consequently weight and size) in generators
>and transformers.

I'll agree with you there. It may have also come about because better transformer steel became available. Plain iron has losses that increase dramatically with higher frequency, so perhaps using higher than 25 Hz would have resulted in inefficient transformers. Then silicon steel was developed for transformer cores, allowing 60 Hz operation while keeping losses low. But I'm too young to have been around at the time, so this is speculation.

YOu may be able to subsitute a 1N4007 diode for it. TT has recommended
using that diode for a replacement in their 6 meter transverter. The
1N4007 diode from the 4000 to 4007 series is suspose to be the only one
that uses the pin method.
Youy should be able to find that diode as it is a common one rated for
about 1000 piv at 1 amp if I remember the ratings correctly.

Good advice below but you can make it even better if you get a couple
hundred feet of RG58 and put the dummy load at the end of it.

Date: 1999-11-27 00:00:00 UTC
From: Reg Edwards <G4fgq.Regp@btinternet.com>
Message-ID: <81prapor1@uranium.btinternet.com>
Source record: 65334

The frequency, from DC to several KHz, single-phase or multi-phase,
for power transmission is invariably selected to provide least energy
loss for the greatest amount of energy transmitted during the expected
life of the transmission system, including transformation and
mainenance costs.

Ultimately, calculations reduce to maximising the profit returned to
the shareholders and minimising charges made to energy consumers.
When energy generating and transmitting companies are nationalised the
consumers ARE the shareholders.

Reg.

As a kid in the 1940s I remember seeing flickering incandescent
lights on a 25 Hz supply. It was in a small town somewhere in
Arizona or New Mexico; I can't remember just where.

They DID flicker noticeably and when I asked my Dad why, he
explained that it was the 25 "cycle" power.

The technique of putting lossy cable before a dummy load is commonly
used in verifying the performance of a duplexer, for instance. The return
loss of the cable diminishes the effects of the dummy load's
generated Intermodulation distortion, which can desensitize the receiver.
I think that there is no problem if the RG58 is used in low kW applications,
if it is a 50 ohm system. I have done this for years.
Al

I'm not that familiar with those amplifiers but my guess is that the SSB mode simply adds a delay so it doesn't keep dropping back to receive mode between words. I doubt that there is anything much different in the actual amplifier, although it's possible that the bias is shifted slightly to make it more linear. In any case, that won't harm operation in FM mode I'm sure.

==========
Caddock Electronics Inc. 1717 Chicago Ave. - Riverside CA92507-2364
(tel: (714) 788 1700) make excellent non-inductive ,power film
resistors in a TO-220 package . Their model Kool-Tab MP820 can
handle 20 Watts and is available in various values , standard item
tolerance is 1% Range available from 1 to 10000 Ohms
For a 100W -50 Ohms dummy load you would need 5 resistors of 250 Ohms
or 8 pcs of 400 Ohms on a BIG heat sink .placing the resistors in a
circle with shortest possible lead to RF connector and ground.
When using 8 or more resistors some creativity will be necessary when
using more than 1 heat sink whilst ensuring shortest possible wire
connections . Although the latter is highly likely only essential
for freqs > 30 MHz
A cooling fan will probably be very useful at higher power levels.

Hello all,
I have a 2m 70 watt amplifier. It has a toggle switch to choose between FM and SSB. I have it remotely located in the car. I operate FM most of the time but also some SSB. Can I leave the switch in the SSB mode and transmit on FM without damaging it???? I know the in the FM mode won't work when transmitting SSB because of the lack of a carrier with out the audio but I don't see what it would hurt to have it in SSB and transmit on FM.

Thanks for all your help in advance.
73 and God Bless
Bill

Alas, Delta is now just a computer store, but they used to be a great surplus
outlet in Doraville. Austin Electronics is still around (off Oakbrook Parkway).
They have a fair assortment of new and surplus parts.

For new parts, there's Tech America (now Radio Shack.com) on Buford Highway.
Also in the Norcross area are branches of all the major distributors, Wyle, Pioneer,
Hamliton Havenot (really Avnet), etc. Unfortunately, most of them aren't stocking
sites. They'll have your part for you in a couple of days, but then so will Digi-Key.

This depends on the rated power and rated voltage of the bulb.

I once tried to use a simple rectifier to reduce light output in 50 Hz
and 230 V environment. This produced 50 light pulses each second, as
would both halfwaves from a 25 Hz supply. The light was very flickery
on 40 .. 60 W bulbs, but was quite nice on a 250 W (non-halogen) spot
light due to the thermal mass.

Rick: I'd advise you to start out with some less ambitious homebrew
projects. Gain some experience, get some easier projects working
right and then, later, take on your big dual band digital readout rig.

Lot of novice homebrewers start out by taking on projects that are
really too advanced (that's what I did). They get frustrated and
retire their soldering irons. Why not start out with some simple
receive converters for 6 and 2? Or maybe some QRP transmitters?

Good Luck 73 Bill N2CQR

Leave it in the ssb mode if you want. All that does is fix the time
delay to keep the relay from dropping out between words. Most amps just
add in a capacitor in the relay time delay circuit. Nothing is done to
the RF part. YOu can run an extra wire to the amp and hard key it
instead of using the RF to do the job and not worry about it dropping
out or waiting the extra second or so for it to drop while using FM.

>Capacitance is normally only a problem with underground cables, wires on pylons
>have much less as they are wider spaced.

In submarine DC cables the sea floor and the water can be used as the
return conductor, thus only one isolated conductor has to be laid.

This was first used in the HVDC cable between Sweden and Gotland in
1954 (http://www.si.se/eng\esverige\inventio.html).

The 500 MW 400 kV Fenno-Skan link between Finland and Sweden is also a
single conductor type (http://www.abb.se/pow/l1112.htm).

In addition to transferring power, the return current has also been
used for geological studies (http://www.gf.oulu.fi/~pjk/fs_abs.htm).

Normally FM amplifiers are class C ones and operate saturated to get
more efficiency as the power is constant (independent of the modulation)
and DON'T serve for SSB transmission because the latter is an amplitude
modulation method and the audio will be severely distorted.
For SSB we need a very good linear amplifier to keep the information
fidelity and to avoid intermodulation products.
Besides this, the peak power output for a SSB transmission is higher
than for FM (despite the average power can be the same). So, if you
excite a SSB amplifier with a FM signal getting full output, it is
likely to damage the output devices because they will be operating
continuously with the maximum peak power condition.
So, if you want to operate FM on a linear (SSB) amplifier, you will get
less efficiency (but no distortion problem) and must be careful with
the average power you will give off.

While you'd see all kinds of schemes to generate touch tones in the early
days, there is no reason at this time to use anything other than a crystal
controlled generator for touch tone. The others are just too unstable in
the long term, and you actually have to adjust them in the first place.

I thought those other "boxes" didn't work anymore. And just because
someone wants a function generator IC like the 2206, does not mean
they want to control the phone system.

4497. Definition of IP3?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-28 00:00:00 UTC
From: Tomas Ahrne <dirac@takethisoutalgonet.se>
Message-ID: <YTg04.3886$ra7.32441@news1.online.no>
Source record: 65264

Hi,

I am designing an RF stage that needs to have quite low intermodulation distorsion.

When reading data sheets for various amplifiers they usually give a figure fo IP3.

What I haven't found anywhere is if IP3 is related to the input or the output. Can ayone help me on this point?

I need ntermodulation distorsion to be at least 100 dB down at the output of the amplifier at a level of 1.5 dBm, and I need a gain of approximately 30-40 dB.

If IP3 is realted to the input, then I reason like this: Mini-Circuits has an amplifier called HELA-10. IP3 is 47 dB and GAIN 10 dB. I could cascade 3 of these to get 30 dB gain. For the last HELA-10 in the chain, the input will be 1.5 dBm-10 dB = -8.5 dBm. Since 3rd order intermodulation products change twice as fast as the power of the input signal, then if the input to the last HELA-10 is at -8.5 dBm, 3rd order intermodulation products must be down 2*(47-(-8.5)) = 111 dB.

The general formula for calculating my resulting 3rd order intermodulation products must then be 2*(IP3 - 1.5 + GAIN). The 1.5 is my desired output level of +1.5 dBm.

If the above is true, then it is not IP3 that is important, but the sum of GAIN + IP3. Mini-Circuits has another amplifier, MAR-8, which has an IP3 of 27 dB and GAIN of 32.5 dB. GAIN + IP3 = 59.5 dB.

So my questions are:

1. Is IP3 realted to the input of the amplifier.

2. Do I think right when I say that it is GAIN + IP3 that is important?

3. Is there anything else I should think of?

Best,

Tomas

4498. Re: Definition of IP3?

Source record: 65265

Some Good References are;

Solid State Design for Radio Amateur by Wes Hayward ï¿½ 1977 ARRL, Inc.
LCCCN 77-730-94

Solid State Radio Engineering by Herbert L. Krauss ï¿½ 1980 John Wiley &
Sons, Inc.
ISBN 0-471-03018-X

Designing With Field Effect Transistors by Arthur D. Evans ï¿½ 1981
McGraw-Hill, Inc.
ISBN 0-07-057449-9

In a nutshell cascading stages does not produce a linear reduction of
IP3.
Each follwing stage degrades the next stage by at least 3dB. Depends on
each
stage's OIP and Gain. Don't forget Noise Figure also gets degraded.

--> Interesting problem. Have you looked at some of the CB stuff? A lot of
it's junk for people who don't know better, but if you find something good
you could probably retune it for 10 meters.

My 10 meter antenna at home used to be a CB base station vertical, shortened
up for a good SWR on 10. (Accomplished by jamming all the sections further
together, then drilling new holes for the sheet metal screws that held
it together.)

I have worked with some industrial heat transfer oil made by Dow Chemical called DowTherm. Not sure of the chemical / physical properties but I might be able to find out.

The particular version I had to put up with had the consistency of wax when it was cold, but it was very efficient once it got up to a very high >300F. Safer than using steam in that application. No pressure!

>If anyone knows of a source for these, I would appreciate it.

The MV1401 went out of production about 10 years ago because the
large glass package it used (to accomodate the large chip that had
the high capacitance) was discontinued by Motorola [general
obsolescence of through hole parts).

Fortunately, you can simply substitute an AM radio tuning diode
such as the Motorola MVAM109 or MVAM115. Philips, Siemens, Toko,
and others also make AM radio diodes, but the type numbers are
different. These diodes will always be made in huge quantities as
long as there is an AM broadcast band.

You can also parallel a bunch of lower capacitance high gamma
diodes. This has the advantage of higher Q. OTOH, Toko makes
diodes with even more capacitance than the MV1401.

Dave (or anyone else),
I need a gallon for my dummy load. If single gallons are not available, I'd be interested in buying a 5 gallon pail if that is available.
Ted N1XLW.

Hi,
I just was woundering if anybody has tried this idea,
using a peltier device to cool a VHF or UHF gaasfet
mast head preamp.
And if so did / does it have any effect on the preamps
performance noise figure etc ?

Thanks for your thoughts Martin G1GYC

I would think this might prove beneficial for EME where the array looks at cold sky. But, the NF of today's devices for V/U at ambient temp are already below what I would think is sufficient for terrestrial communications where the array looks at warm earth and other noise sources that probably mask very low NF's.

Message-ID: <s46h9penmvm88@freenews.remarq.com>
Source record: 65197

I just came across this item in my junkbox. It is a three inch long
silver tube with a male BNC on one end and a female on the other.

It boasts the following text on the label and looks new.

NEG. DC OUT
Teletonic Berkeley
CRYSTAL DETECTOR
MODEL 8551 50 Ohms
S/N 00641-13
.1 - 1500 MHz 3V. MAX
RF IN

Should I build a receiver around it, use it as a RF probe, or what,
please?

- Thanks! & 73, DavidC K1YP

Thanks for the info - I am planning on using the box for shielding. I left one bit of info out of my original post that would explain why I can't use the mic ground - I also want to install a headphone jack in the box - and the headphone line has it's own ground.

A friend of mine built one that I used to borrow from time to time. It was built into copper pipe (about 2" I think). He used a short piece of copper pipe and two end caps with a BNC connector soldered into the end of one of the end caps. Inside he used a series/parallel arrangement to fit as many carbon resistors as he could such that the result was 50 ohms. It worked great because the copper pipe dissipated heat very well. You could also solder sheet copper fins to the outside to dissipate even more heat. He didn't fill his with oil, but I so reason that you couldn't. That would carry the heat to the outside even better.

TIL-306 can be found just with Newark Electronics or with Telepath
Internet at http://www.telepath.com/dwarders/semicond5.htm (this is a
'hard to find' site). Dial Electronics at
http://www.dialelectronics.co.uk/t8.htm seems to have it too.
TIL-308 seems to be more difficult to find but try Elfa at
http://www.elfa.se/elfa/produkter/se/20/2011621.htm

4519. Re: Where can I find plans for a Homebrew 6M SSB or 2M SSB Rig?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-29 00:00:00 UTC
From: "mikael.nordman" <mikael.nordman@lmf.ericsson.se>
Message-ID: <38425664.289344D3@lmf.ericsson.se>
Source record: 65278

Hi Rick,
I have made a 6 m SSB rig.

It is made using the 'dead beetle' contruction technique.
This technique uses an unetched copper PCB as a ground plane and the
other wiring is in the air.

I would like to put up the schematics of the 6 m rig on the web, but I
have not found a decent
schematic drawing program yet.

The main problem with such a project is to find suitable components.
Therefore it is important to understand the principles of the stages in
a transciever,
so you can apply the available components to the stages.

I used a technique like this:

WHILE((Transciever = Not Ready) AND (Builder = Not Dead))
1.Read the ARRL handbook
2.Check which components are available
3.See what others have done (homebrew pages on the web)
4.Read and understand the AARL handbook
5.Find used old SSB equipment to get hold of
'diffucult' components like VFO, SSB filter, carrier crystal.
(I took mine from an broken DRAKE TR-3)
6.Try to apply what you know and what you have(components).
7.Decide what kind of casing to use (RF aspects!).
8.Build another prototype
9.Test it
END WHILE

4521. Antenna tuners

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-11-29 00:00:00 UTC
From: Agust <agustNOagSPAM@rt.is.invalid>
Message-ID: <000b8d9b.5858eeca@usw-ex0101-002.remarq.com>
Source record: 65280

Hello!

I have had a license since 1964 (TF3OM), and intend to fire up my old rig again. I have not been active for many years.

I would like to ask a few questions regarding commercial antenna tuners that are available. I have been scanning the web and found some. My current antenna is a LW, but I intend to put up a G5RV or similar. Transceiver is an old 100W solid state Kenwood TS-130.

The tuners that I have been looking at are:

MFJ-949E from MFJ Enterprises.
VC-300DLP from Vectronics.
MFJ-969 with roller inductor from MFJ Enterprises.

All are 300W.

The VC-300DLP seems to be a little more expensive than MFJ-949E, but with similar specs. Which one is better?

The MFJ-969 has roller inductor. My interest is 3.5-30MHz. Does this one have any advantages?

Do the above tuners handle practically any mitchmatch? What is the approximate impedance range?

Any recommendations?

Best regards

Agust

Mobile 1, a synthetic oil, is or was based on polyoctene which I've used for many years in a dummy load. Will take a lot of heat and is very stable.

I am considering buying a used RFC 2-117 2m amp.

The finals are Motorola SRF 3897s. I don't see them listed by
the usual suppliers on the Internet. Are these no longer
available? Is there a direct substitute?

- Thanks! & 73, DavidC K1YP

Hewlett Packard HP400LR VTVM with manual

Measures rms voltage from 0.001 to 300 volts full scale over a frequency range of 10 Hz to 4 mHz. Input impedance is 10 megohms. Also provides amplified output of the measured signal. The front panel is in good shape, and it is very clean on the inside. I have checked the accuracy at several levels and it appears to be right on. A copy of the operating and servicing manual is included.

Tomas wrote:

>Is IP3 related to the input of the amplifer.

In general, IP3 is related to the output for amplifiers and to the input for mixers.

In the example using the Mini-Circuits amplifiers, the output 3rd order intercept point will remain at essentially +47 dBM. With an output signal at the +1.5 dBM level, the distortion products will be at a level of -89.5 dBM. This is only 91 dB down from the output level and not the 100 dB desired.

In order for the distortion products to be at a level of -98.5 dBM, which is 100 dB down, the output intercept point of the last amplifier must be at least 51.5 dBM.

A Mini-Circuits MAR-8 will make things worse because of the lower OIP.

Gain has nothing to do with these calculations. However, something to keep in mind is that increasing gain reduces dynamic range at the high signal level end. While an increase in noise figure reduces dynamic range at the low signal level end.

I still use the 2206 in my tone generators, and will sell them in single lot quantities at $6.00 each including US continental postage.
JAMECO, as noted in other responses, still sells them, though I don't recall their current minimum order policy.

Source record: 65287

I'm a novice homebrewer and am just building simple accessories for my shack. I want to build some audio / mic switchboxes and I am concerned about ground loops.

Specifically, I have two microphones (one desk, one headset), both of which use a miniature phone plugs. I'd like to build a switch into a box that would allow me to leave both mics plugged in but use a DPDT-center off switch to select which (if any) mic is connected to the radio. I envision a small metal project box enclosure where the box itself is grounded to the shack ground. The problem is that the typical panel mount phone jacks are metalic and the barrel connector will be in contact with the panel and thus grounded. The mic input on my radio uses a separate ground. I don't think that it is a good idea to connect the mic and shack ground. Is there a recommended way to isolate the jack from the box?

>

Let me suggest another 300W tuner: The Palstar AT300LCN. Palstar is a company started and run by Jim Hrivnak who founded Vectronics (although he is no longer associated with Vectronics). Check out their web site: www.palstarinc.com.

> The MFJ-969 has roller inductor. My interest is 3.5-30MHz. Does this
> one have any advantages?

Both of the the MFJ-969E and the VC-300DLP (and the Palstar, also) have 48 position inductor switches which gives you a lot of inductor choices. The Vectronics ad says that you can switch the inductor with power applied. I assume that the MFJ allows you to do that also, but that might be worth checking out. With these two features, theres probably no real advantage to a roller inductor in your case.

A long time ago, I got a gallon of transformer oil for my Heath Cantenna... I visited a transformer rewind/repair shop (happened to live in Tucson at the time), and asked for it. They gave it to me; not worth writing up a bill.

I'd recommend trying the yellow pages of your phone book: find a place that deals with big transformers and ask them. Ask your local power utility (undoubtedly will have to get beyond the front desk receptionist to get any action on this request! But then there may well be hams that work for them, too...). As a last resort, check petroleum products distributors and ask specifically for transformer oils...they likely will have catalogs/data sheets. In that event, you might indeed have to settle for a 5-gallon can of it. Share with other hams in your area? I'd expect by this time that there won't be any PCB-laden oils left in service in the US in any transformer serviced in the past 20 years at least.

Cheers,
Tom

Source record: 65291

My first inclination would be to connect the box only to the mic
connector ground, not any other ground, and go ahead and use the
grounded jacks. If you want to use station ground for the box, you're
right, you want to keep the mic ground separate from that. You can find
plastic or fiber washers for insulating jacks, etc., though that's the
sort of thing I've accumulated over the years from taking things apart
and from "looks interesting, might use these sometime, they're cheap,
get some" surplus-store raids, and finding just what you want when you
want it isn't always easy. But...since everything in the box then would
be isolated from the box, and only the box is connected to station
ground, why bother with the box? For shielding? If so, why not connect
it to the mic ground instead? If you don't need the shielding, why not
just use a plastic box to begin with?

Cheers,
Tom

The Motorola SRF seires is a custom made device.
It is protected and as such cannot be purchased without the written permission of
the origional customer.
You can't even get specs on the device.

Once you put the resistors in oil. you can increase the rating.

I used to put 50 - 100 W into a few watts worth of metal film
resistors. I used automatic transmission fluid (recommended in a
magazine article) and soldered the resistors between two metal plates.
I used a coffee can with a coax connector soldered into the lid, and the
resistors soldered to the inside of the lid. The coffee can lets you
open the lid when necessary. Mostly used it on HF, but it handled 144
MHz ok with a reasonable SWR.

==========
In 1985 ,when I was first licenced I made a dummy load comprising 20
pcs 1000 Ohms ,2W metal film resistors
fitted to the circular lid of a cocao tin , with the resistors
immersed in standard motor oil.
Last week ,after having not used the dummy load for a long time ,the
resistance measured was 52.5 Ohms
After heating the load for a couple of hours with a 24 V DC supply
(power : 24sq / 50 = approx 12 Watts)
the resistance measured was 50.6 Ohms and after cooling down to room
temp. I measured 49.8 Ohms.
Just before I started this message the resistance measured was 50.4 Ohms.
The motor oil has never been changed since 1985. The varnish /
paint on the resistors apparently is motor oil resistant. As
long as the resistors are just bare carbon , just try motor oil. A
KISS solution.

I've done this before on a PRC-47
unbalance the ballanced modulator by
opening one side of the network via
a normally closed or normally open
(I forget) relay contact. choose a relay
with a voltage that is readily available in the radio like 12v, or 6v. Key the
relay
via telegraph key at the cold end of the
relay.

That'd be about right, the Peltier devices work well on Paramps, so don't see why they would not be beneficial on any input device.
You should take particular attention to the input losses of the amp this is where most of the noise is generated, (provided the stage gain is large enough to swamp the noise from the following stage).
You should be aiming for input losses to be of the order 0.1 dB or less.
Input VSWR is important; very much more so than for a transmitter.

Radio Astronomers routinely achieve noise figures of 0.7 dB with custom built L-Band (1-2 GHz) GaAS FET amplifiers, and 0.15 dB Noise Figures when operated at LiN (Liquid Nitrogen) Temperatures.
The corresponding temperatures are 50°K and 10°K.

When the Moon fills the aperture of an antenna at 2 GHz the Temperature when measured with an Rx of System Temperature 40°K comes out between 120°K and about 150°K, depending upon the phase of the Moon and just where on the disc you point the measuring Antenna.

A typical Ham Rx would see a lower temperature than this because the physical size of an antenna available to a ham of normal means would have such a wide beamwidth that the Moon's disc will only fill a part of the Aperture. Under these conditions a bit of noise figure enhancement may contribute a little, but not a lot.
However if you are going to be looking at cool sky, (you should measure that at about 4°K), any reduction of Noise Figure will increase usefulness of the Rx.
The improvement might not be worth the additional expense if you are not a dedicated Radio Astronomer.

Cooled Amps using high-electron-mobility (HEMT) FET get down to 5°K at L Band and 15°K at 8.5 GHz

Good luck with it anyway, you'll get loads of fun just trying to measure the improvement. To do so you'll need a hot and cold load to measure System Temperature.
note:
The better conditioned formula for reliable accurate results is:

Ts = (To-Tn) / (Yna(Yon-1))

To is an ambient load
Tn is a load immersed in LiN (liquid Nitrogen)
Yna is the ratio of the noise power from the nitrogen Load and the noise from the antenna when it is pointed at cold sky or the moon what ever condition you wish to measure.
Yon is the noise power difference between a load at ambient temperature and a load at LiN temperature (this must be increased slightly because of the loss of the feeder into the load that is at ambient temperature.)

If anyone is interested in the calculations I'll be pleased to send them.

You might see a formula Ts = (Th-YTc) / (Y-1)
Th is the hot load
Tc is the cold load
Y is the ratio of the noise powers from each of them in turn

But this formula does not behave well under experimental conditions and spurious results are unavoidable. Mathematically they are equivalent, but slight errors in the measurement are magnified.

It is possible to use dry thin sand (not salty) instead of oil to get more dissipation. I've used this method for long in a homemade load.

The devices must be built in a pyramid to achieve the temperatures low
enough to make any difference.
Each device has about a 45 degree reduction in temperature.
On the CCD chip we were cooling we needed a stack 8 levels high!

Mark: I once needed to keep both lines going to a speaker isolated
from chassis ground. I had a receiver mute scheme that worked by
lifting a line above ground on transmit -- I wanted the speaker ground
to connect to the mute line (and chassis ground) ONLY when I was in
receive mode.

I just got some STEREO phone plugs and stereo phone jacks. These have
two lines that are isolated from ground. Should work for your
application. Good luck. Let me know if this solves your problem.

Hello,

I recently added a PREFIX look-up form on the QSL page. If you need to know where a prefix is from, simply enter the call or prefix and see what country it is assigned to.

You are invited to http://hfradio.org, a non-commercial site offering:

+ Azimuth Map / Equidistant Map Creation (choose any QTH as center, many options)

+ Propagational Resources (live, real-time reports, eAlert service (sign up for automatic email solar/geo reports, complete with Aurora index))

+ News, and DX information and reports

+ QSL Manager and Callsign Lookup center

+ Swap and Shop

+ FREE HOME PAGES THAT YOU CAN USE TO POST YOUR OWN HAM OR SWL SITE

+ Bookstore - SWL and Ham related books. Over a 1000 titles so far.

+ Plus more (Directories, etc.)

73!

Thanks Bill,

I never thought of using stereo plugs in that way. Actually, the mic
connectors both have stereo plugs already on them, but use the tip and
barrel connections - the ring is unused.

Okay, I'm starting to understand. What does this mean for an external audio input device, such as a DVR? Since it is connected to the mic input of the radio, should I ground the DVR chassis to the station ground?

> The headphone side of life is a complication. It would be best to leave
these

wiring to
> the box at RF using 1000pf capacitors with short leads.

I guess I could build the headphone connector into a separate box and just mount it near the mic jack box. My purpose is to provide a convenient place to connect the headphone and and mic from the headset, so that I didn't have cables going all over. Two adjacent boxes mounted under the shelf supporting the radio should work just fine.

I've been known to mount a small piece of plastic in a rectangular hole in the box, and then mount some jacks in the plastic. With my metal/plastic-working skills it tends to be somewhat ugly, but it does work fine.

Peltier chips are interesting, but probably not very practical here.

1) They can support something around a 40 degree effect under IDEAL conditions, so you
would need to stack them.
2) They are EXTREMELY inefficinet, and require HUGE GOBS of current at 12V DC. You will
spend alot of money on a suitable power supply.
3) Due to their inefficieny they require very large heat sinks, preferrably with forced air cooling. If
the sink is too small or the flow is too low, the peltier chip becomes very very hot on both sides (i.e.
it becomes a heater).

You know, the difference in cooling capacity is so close, that using
real PCB laced transformer oil and a safe alternative that you'd never
even notice the difference in a HAM environment.

This is starting to remind me of a power war. Sure, 4.2Watt is
better than 4.0Watt, but does it really matter in practice?

On this NG and others it has been reported that the MFJ ATs can't
really handle the power they are meant to
handle.....because of components rating.

I have not come across any comment on Vectronics tuners

I'd agree with Dale Parfitt's comment that it might simply not be worth
the effort, and add a warning: be careful that cooling something like
that may lower its temperature below the dew point, and you may end up
with water all over it. This can be a bad thing for electronics...
it's kept me from using Peltier coolers for one or two things I've
thought of.

Cheers,
Tom

Gee, when I mentioned that you probably won't find any PCB laced transformer oil nowdays, it was simply a comment for the safety-minded. It didn't even occur to me that there would be any _significant_ difference in heat capacity or heat transfer characteristics between the 30-year-old stuff and the modern transformer oil. So...if it was the start of a "war," I promise that it was done with no malice. :-) (I'd personally just as soon simply keep PCBs out of my life so I'd avoid the old stuff, but transformer oil was easy enough to get that it just didn't seem worth messing with 10 bottles of mineral oil from the drugstore [and the strange looks from clerks] or some unproven motor oil.)

Cheers,
Tom

I've done the same thing, but I've used pieces of circuit board. With
a little practice, you can fairly easily peel the copper foil off,
leaving a pice of insulated board. Or I've left the foil, and used
a Dremel tool and appropriate bit to carve an insulating moat around
the area that needs isolating.

The advantage of circuit board is that it's handy, I'm familiar with
cutting it, and you don't have to hunt around for a thin piece of
plastic.

And if we're talking about circuit board, you can make useful boxes
out of the stuff. Usually the ones I've made tend to be uneven,
but they are cheap. One could make a shielded box for the area that
needs shielding, and then mount it in a plastic box for neatness.

And then in this particular case, the jack that needs to be insulated
from ground could be mounted on the plastic box, rather than in the
shielded section.

It also is a peak detector, so you may observe modulation envelopes
with your o'scope, even though your scope does not have the bandwidth
to see the carrier frequency.

I think he's talking about polarization. Aren't FM antennas one way and SSB antennas the other? FM is vertical, and SSB horizontal, yes?

And I think I remember that this varies from place to place. I honestly haven't any idea how much difference it makes. Anyone know?

Huh? He's asking for a pc board mask. People do do that, I think.

Speaking as one in the middle of this exact process, I can tell you it's not easy. If you're very organised (I'm not) you stand a better chance of seeing something like this through.

I've got a miniR2 built and packaged, and have tested it at HF with a signal generator as the LO, but I've yet to build and package a six meter VFO. I'm doing the premix thing, with an HF VFO and a nice old air variable, but I've found it's very hard to figure out how to properly mount that big, clunky old air variable inside a nice hammond die-cast aluminum box. Sigh.

And that only leaves the T2, and maybe the LM2, and the phasing networks, and... maybe I'll just buy an FT-100... NO! MUST NOT BUY APPLIANCE! WILL BUILD OWN RIG! ... but those FT-100's look pretty slick, and my vx-5r works well, and the ft-100 is all mode on six and two, and I could just pop over to the HRO.... NO! MUST BE STRONG! MUST NOT GIVE UP! but at this rate, I may miss the whole sunspot cycle.... or how about an ic-706mkIIg? NO! :-)

Seriously, though, I think Hands Electronics may be making a modular 6M SSB kit
-- kanga US resells Hands UK kits too. check it out.
http://www.bright.net/~kanga/kanga/hands.htm

Also, FAR Circuits carries lots of published circuits as unpopulated etched
boards, look for them with www.google.com.

Hello and Greetings:
I have a Heath Kit HW 18 Crystal Controlled Transciever. I would like to know what the Frequency range for this unit is? Is there anyone out there will to sale me a HeathKit assembly manual or a copy of the manual. All that I have is the Mic , Power Supply, and the Radio itself.
This unit was originally designed for M.A.R.S. and C.A.P. use...is there anyway to convert it for amatuer use?

Thanks in Advance.....

4565. RF Power Transistors

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-01 00:00:00 UTC
From: Jim Weir <jim@rst-engr.com>
Message-ID: <1U5FOKuGVYVuobYmT+Xz5PpDSWl6@4ax.com>
Source record: 65144

I need to make a bunch of 2-meter linear amplifiers that have about a 10 watt output. It used to be that Motorola made a real nice line of inexpensive transistors that would take you in 15-20 dB steps from 10 milliwatts to 10 watts in about three steps. Now they only make a 10 watt device and the driver and predriver are gone.

Who makes a decent line of 100 mW, 1W, and maybe even the 10W output device in current production? I've done the searches on most of my RF web sources and have come up dry. I'd prefer to stay in bipolar, but FET will do if I can find a 12 volt series of fets. Most of them want 28 or 50 volts, and I just don't have that voltage available unless I go to another power supply, but that is a whole other design task...

> > > how could I build such an antenna out of either wire or pipes?

> I think he's talking about polarization. Aren't FM antennas one way and SSB
> antennas the other? FM is vertical, and SSB horizontal, yes?

This may qualify as a FAQ, but it's covered an any good handbook on
the topic.

VHF FM uses vertical because (a) VHF FM is largely mobile, and
vertical antennas are far less awkward mobile than horizontal and
(b) with the FM capture effect, the noise implications are
(mostly) irrelevant. Since VHF FM is largely line-of-site, the
fixed stations talking to the mobiles need to be vertically
polarized too. (Mobile convenience is also why 11m/CB uses vertical
for nearly everything, in spite of being SSB/AM.)

On HF, usage varies. The preference for Horizontal polarization in
HF skip modes (of whatever modulation) is based on the observation
that most man-made EM noise is vertically polarized, so horizontal
antennas are quieter. With Rayleigh Rotation, the received
polarization of an ionospheric-skip-mode signal is random and
changing anyway (hence SOME of the fading). Which is why you can
use an HF vertical to communicate with a station using a horizontal
dipole (at significant penalty on ground-wave and not at all on NVIS).

For VHF+ SSB/WS modes, custom is to use Horizontal -- in part because
of HF usage, and in part to get the cross-polarization attenuation
protection from all the vertically polarized VHF signals in-band and in
adjacent hi-power bands. For SSB/WS modes, the vertical polarization
of man-made noise might also be a an issue?

But when the MUF gets up past 50MHz, there's no reason you can't use
vertical polarization on 6m when you try to work the world 6-side-band,
since it will rotate as is refracts just like HF (even more-so, IIRC).
My 6m QRP SSB/CW rig, Icom 501, has a whip as well as an SO-239.
It's difficult to do Horizontal with a whip, but I've done it :-)

I don't know what effect tropo-ducting or meteor scatter has on
polarization -- probably have to ask in rra.antennas or elsewhere to
get that answered?

Likewise, 10m FM could be done with an existing 10m horizontal
antenna when looking for DX ... and would probably work LOS locally

provided it's not QRP. (Haven't heard of any FM lower than 10m ...
which was previously considered VHF, but is now officially HF ...
and acts like both, as do 6m and 11m.)

> And I think I remember that this varies from place to place.

Not much, although a local LOS SSB net could agree to use Vertical
because it's easier. With "Halo" antennas, omni horizontal is
pretty simple to stick up there too.

Holy smoke! I trimmed the distribution a bit...seemed excessive.

You should be able to scale the frequency of a VFO on other freqs...in general, you can scale all the capacitors and inductors, though if you're not moving it very far, you can usually leave the bypass and coupling caps unchanged.

The oscillation frequency should be 1/(2*pi*sqrt(L*C)), where L is the inductor (usually only one inductor) and C is the net capacitance across the inductor. In practice, you might well have capacitors in series and parallel, and you have to just think about it from the inductor's point of view: what does the inductor "see"? You might want to include a guess for the input capacitance of the oscillator transistor, and maybe a little for the stray circuit capacitance, though at 4MHz all that should be a pretty small effect.

Usually one of those capacitors is variable, to get your tuning. There might be another one that's variable for trimming, and/or the inductor might be trimmable. But you can figure out the tuning range by plugging in the min and max values of the tuning cap while leaving everything else the same. You could do some math acrobatics and moosh your formula around to give you the tuning capacitor capacitance required for min and max frequencies you want to cover.

How do I do this sort of thing in practice? One easy, useful way is to use a spreadsheet like Excel. You can make a column of tuning capacitor values (corresponding to, say, 0degrees through 180 degrees rotation, in 20 degree increments), then a column of net total capacitance (the tuning cap combined with fixed caps), then the frequency (net capacitance and inductance, in the formula above). You can put all the "fixed" values into cells at the top, and use formulas in the columns that get the "fixed" values from those cells...then it's trivial to change one of the "fixed" values and see the new set of frequencies that results.

And you can plot freq versus cap rotation easily, and see visually both what range is covered, and how linear it is.

The spreadsheet lets me compare different parts values and also different circuit topologies quickly. I use spreadsheets for this sort of thing quite often in both hobby and professional work. They're not just for accounting!

Cheers,
Tom

The HW-18 will tune up on the 75 meter ham band and its possible to connect a VFO into one of the crystal sockets. You will be able to get about 50 kHz worth of spread before you have to go inside and re-tweak things (for best output, etc.) The HW-18 was designed to work, nominally, from 4-5 MHz, as I recall. The HW-18 was a spin-off from a Heath model that had a VFO and covered the entire 80/75 meter band. I think they (Heath) may have had one for 40 meters, too.

Jim,

Motorola has abandoned the low voltage/low power RF segment. There just
isn't any market for them. The consumer electronics market is now 5V/12V
FM-only devices. Some hi voltage/hi pwr devices still exist.

Philips has a small market, as does ST Microelectronics. Old favorites
like the 2N4427 simply disappeared. The 2N4427 is supposed to be
re-introduced by Unitrode sometime next year.

Hope this helps.

You can also use heat transfer oil, this stuff is used for the heat
treatment of metal. They produce tons of the stuff and is much cheaper than
transformer oil. There are many different grades, for fast or slow removal
of heat. I have used this stuff with great results.

i use a old oil electric heater, it has a 2400 watt element with the already inside. Just rip off the power connector and install SO239 socket and feed into an antenna tuner, a instant 3kw cheap dummy load.

Hi Mark,

10,106 khz is a good QRP frequency on 30 meters. Try not to get a crystal higher than 10,120 khz because you'll be in the digital portions of the band & not too many fruitful CW QSO's there.

Try Bry's crystal page for various sources of crystals.

Been thru all of that stuff. I was forced to modify a Heathkit roller inductor type tuner to get the g5rv to work properly on 160 mtrs. I suggest taht you get an older ARRL handbook and build your own. Best solution that i have found for the antenna problem is 265 ft wire center fed with open wire line and coupled to a balanced antenna tuner. I am able to work all bands with no problems. Contact ag6k (rich measures) at his web site, he shows a perfect balanced antenna tuner. I built it and i cannot believe how good it works. You can purchase the roller inductors at Fair Radio Sales (on the internet). If you have any questions etc. contact me via e mail.

If you were here i would give you 50 gallons of it. However go into the yellow pages, under x-ray equipment repair, look for a local independent dealer (not G.E., Picker Siemans Etc) tell him what you need. Guaranty he will tell you to come down and take all you want. Presently when we want to get rid of oil we have to pay to have it disposed of.
good luck

4583. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-01 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <822ism$4dj$1@news.hawaii.edu>
Source record: 65240
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

*rec.radio.broadcasting (devoted to the broadcast industry; moderated)*
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6O
(rec.radio.amateur working-group)

*It's been sadly reported that the moderator was lost to us in an
automobile accident; the future of this newsgroup is not known. 73 Bill...

Celwave TDN7407 duplexer used by Motorola. This is the same duplexer found on R100, GR300/500 and GR1225 repeaters. Small 6 cavity mobile type duplexer with N connectors. Will handle up to 50 watts RF.

Will tune down to the 444 MHz ham freqs and up to 470 MHz. I can have this duplexer tuned to your freqs too.

$ 195.00

I've nearly finished a Morse trainer for the Atmel AVR (better than the
PIC) which would be easy to turn into a beacon, if that is of any
interest.

> 2) They are EXTREMELY inefficinet, and require HUGE GOBS of current
>at 12V DC. You will spend alot of money on a suitable power supply.

Please see this artical from 1908 that outlines the requirements of current and Voltage for a given required condition.

> 3) Due to their inefficieny they require very large heat sinks,

If you can keep the mass to be cooled very small and an efficient Dewar constructed to house that mass then perhaps not such a problem as you discribe.

>preferrably with forced air cooling. If the sink is too small or the flow is too low,
>the peltier chip becomes very very hot on both sides (i.e. it becomes a heater).

If you connect them up the wrong way around they most certainly will.

The Peltier Effect
When one junction of an antimony/ bismuth couple is heated, the current flows through the hot junction from bismuth to antimony (Fig. 261). Peltier observed, in 1834, that if both junctions are at the same temperature, and if a battery is included in the circuit so as to send a current in the same direction as before, then heat is absorbed at the junction T, and generated at the junction t. Also, these heat effects are reversed when the direction of the current is reversed. This is termed the Peltier Effect. It is quite independent of the heat generated according to Joule's Law, which is equal to t I^2 R :
It can therefore be most readily observed by using thick bars of metal in which the Joule effect will be a minimum. Fig. 262 represents the method adopted by Peltier to observe the effect, in which two rods of antimony and bismuth (11 cms. long and 16 sq. mms. cross section) are soldered together to form a cross. If a current is sent across the junction in the direction of the arrow, the deflection of the galvanometer needle will indicate a thermo-current across the junction from antimony to bismuth, showing that the junction is cooled.
EXPERIMENT 75 -- Connect together, as shown in Fig, 263, a battery B, commutator C (with diagonal wires removed), thermo-pile TP, and a low resistance galvanometer G. Pass a current through TP for a short time, and quickly reverse the commutator so as to cut out the battery and complete the

circuit through G and TP. The observed deflection will indicate a current through TP in a reverse direction. By varying the strength of current from the battery it may be shown that the tbermo-current is approximately proportional to the battery current.
The Peltier effect may be explained if we assume that there is, at a junction of two metals, a sudden change of potential which is independent of the potential changes due to the battery. Thus, if a current traverses the junction represented in Fig. 264 from left to right, heat will be generated at the junction since the current will do work in traversing a fall of potential. If the direction of the current is reversed beat will be absorbed to an amount equivalent to the work done in overcoming the rise in potential. The mechanical equivalent of the heat generated or absorbed by a current of strength I in 1 second is given by the equation
JH = (V1 - V2) It = PIt.
The Peltier coefficient P Is defined as the energy generated or absorbed at a junction of two metals traversed by unit current for unit time.
(JH) = tI^2R + PIt
In any portion of a circuit, of resistance R, which includes a single thermo-junction, the total energy generated when the current is in one direction; but if the current is reversed the total energy
(JH') = tI^2R - PIt
The value of the coefficient P is determined by measuring the difference between the above quantities, thus
P= J (H - H') / It
Le Roux adopted the method of Fig. 265 in order to measure the Peltier coefficient. A and B are two antimony/bismuth couples, the shaded elements being antimony, immersed in water contained in two calorimeters.
On passing a current of known strength through the circuit for a given time, the heat developed in the calorimeters is given by the equations
H1 = w1t1, and H2 = w2t2
(where w1 and w2 are the water equivalents of the calorimeters and contents, t1 and t2 the observed rise of temperature).
If Q1 and Q2 represent the heat due to the Joule effect in the two cases, also P1 and P2 the Peltier heat effect, then
H1 = Q1 + P1, and H2 = Q2 - P2.
If a current of the same strength is now passed in the reverse direction for the same time, then
H1'= Q1 - P1, and H2' = Q2 + P2
Hence Pl = (H1 - H1') / 2, and P2 = (H2' - H2) / 2
But Pl = P2, therefore P = (H1 - H1' + H2' - H2) / 4

Le Roux found that the value of P for any couple is proportional to the thermo-electric power of the couple, and also that the value increased with increase of temperature.
More accurate results have been obtained by Jahn (1888) by measuring the heat developed when the junction is enclosed in a Bunsen ice-calorimeter. The Joule effect was eliminated by repeating the observation when the current was reversed.
Thermodynamics of the Peltier Effect
Consider the case of a single antimony/bismuth couple,

with the junctions at 100°C. and 0°C.
Heat is absorbed at the hot junction, and is generated at the cold junction; moreover, these effects are reversible. The current which is generated will also develop in the circuit a quantity of heat proportional to t I^2 R: this is independent of the direction of the current and is therefore irreversible. The whole cycle of operations is therefore not reversible. But if we assume the circuit to have so low a resistance that the Joule effect is negligible, and that the circuit includes some mechanism, such as a perfect motor, which will convert all the electrical energy into mechanical work, then the cycle of operations may be regarded as completely reversible ; for, if the junctions are initially at the same temperature, and if the motor is rotated in the opposite direction, a reverse current will be generated which will produce reversed heat effects at the junctions. With this assumption the circuit is comparable to a perfect heal engine,' in which the ratio of the heat absorbed to the heat given up to the condenser is equal to the ratio of the absolute temperature of the source of heat to that of the condenser. Hence, if P1 and P2 are the mechanical equivalents of the heat absorbed and liberated at the hot and cold junctions respectively when unit quantity traverses the circuit, P2 / P1 = T2 / T1, where T2 and T1 are the absolute temperatures of the junctions ; or,
(P2 - P1) / P1 = (T2 - T1) / T1, or E = (T2 - T1) P1 / T1
According to this result, the E. M. F. would be directly proportional to the difference of temperature of the Junctions, which is contrary to observed facts. This process of reasoning led Lord Kelvin, in 1851, to predict the existence of reversible heat effects in other parts of the circuit besides the junctions. He afterwards demonstrated, when a current flowed through unequally heated conductors, that heat was generated in some cases, but absorbed in others; thus, a current through iron from a hotter to a colder part is accompanied by absorption of heat, while. the same conditions in copper are accompanied by generation of heat. This is known as the Thomson Effect.

As the modern units are semiconductor and the amount of current required depends upon the temperature difference required and the mass to be frozen. It might be a good idea if the transistor manufacturers were to build a Peltier device into a low noise chip such the mass to be cooled is the minimum.

Source record: 65168

I'm interested in building amps for HF, VHF and UHF use.
I'm currently building a 70cms amp using a GS23b - so far
so good!

I'm after a design using the DOD006 tube thogh. I've got my
paws on a couple of tubes, but no design as yet. Should've
done my homework first!!

Anyway, if you know of such a design then please let me
know at :

psmeaton@globalnet.co.uk

And if you just want to swap ideas / circuits / whatever,
to do with this sort of stuff, then that would be good to!

Ditto at 100-150 watts. I have two PCs connected. Both are less than three
feet from my radios (one is on the other side of the wall).

Not exactly homebrew but might be half-way there...
I'm studying for my ticket and searching for prospective rigs and find
a lot of Motorola gear in auctions like e-bay where GMRS radios are
reported by the seller as "can be tuned to Ham frequencies". Is there
a web site out there with info on how-to, to substantiate these claims ?
Some of these radios are programed and synth so it may just be entering
the right freqs or it may take some other code work. I'm interested in
all the techniques.

Please e-mail to dshaughn@peak.org as I (so far) check this news group
rarely (actually I just found it; may be more regular).

Thanks all.
Dave

any 70cm power transistor will have quite high gain on 2m, shouldn't
be difficult to find 'any' 70cm power transistor?

Haven't measured how much gain you get this way on 2m, but experienced
that 2N6082, 2N6083, 2N6084 all have 19-20dB gain on 6m@20W RF with
13VDC supply

I run three computers in my shack, a P3-400 notebook for Sat tracking, a general use P3-500, and a dual processor 24x7 internet proxy server. I have used both 10 base 2, as well as ten base T, with no problems at all at 1500 watts HF and up to 450 watts on 2 meters. The ten base T cables run directly behind my main operating desk and within 2 feet of the HF amp and all of the coax feedthru's to the outside.

Not as bad as you may imagine, Stephen. My radio sets in a room between two Macintosh PowerBooks, a laser printer, a scanner, a cable modem, and all their accessories.

My radio sits about 10 inches from one computer, and the other computer is about five feet on the other side of the radio. The laser printer sits about three feet from the radio. The radio's power supply sits about 2 1/2 inches from the computer.

The computer equipment is connected together by a 10Base-T network. The hub recommends that you keep it about 10 feet from any source of RFI, but so far I've had no problem with the hub placed directly under the laser printer (a good source of RFI) about three feet from the nearest computer.

In fact, so far there appears to be no problems with any of this. The radio does not bother the computer equipment, and the computer equipment does not bother the radio (no noise).

In fact, I'm occasionally typing on the computer while talking to people on the radio. The microphone is mounted on a long boom arm that reaches across the computer and I use a foot switch to key the radio.

I'm not sure this would work in all situations. A radio with more power might be a problem (mine puts out about 100 watts). And many computers generate too much noise to be placed this close to the radio. But it works well for me.

Phil, subscribe to the "AMPS" reflector at www.contesting.com
and post a request on there you should get some (a lot of)
response I would think.

73 good luck with the GS23b amp.
I am starting a refurbish / rebuild of my single 4cx250FG for 70 for
contest use (only 250W ssb but that is ok for me).
so I hope to hear you in 2000 with a big signal hi hi.

:-) You're probably at a point where you'd begin to appreciate some of the reasons why broadcast stations use balanced audio lines and transformers darned near everywhere, to make sure there are no ground loops and still allow for proper RF filtering. I've been away from that industry for a while (30+ years?), and guess they've started to use differential amplifiers instead of transformers some places. Those little audio transformers get a bit expensive for most ham stations, and usually aren't needed if there's only one mic, etc. But there's nothing to keep you from using transformers, which might let you not worry about bonding all your grounds together.

The equipment I design at work generally just has one groundplane, and I'm actually surprised how few problems we have with ground loops. I'm always on the lookout for them, but they are very rare. If your mic and speaker commons are close enough together on your rig, you may get away just fine with simply having them tied together in your switch box. I mean, if I end up with a spurious response 90dB below full scale (which might be 10 millivolts full scale) in my systems, it can be a killer...you can undoubtedly tolerate a lot more than that. It might be worth a try, and if you then must isolate the mic and speaker commons at the box, you can modify the box with larger holes and insulating washers.

Oh, the local Eagle Hardware stores here have a pretty good assortment of nylon washers and sleeves. You may well have something similar there that you could use if isolation is needed.

Cheers,
Tom

Although, I would submit that a somewhat "safer" approach is to use
the "thin coax" ethernet ... in addition to operating in a shielded cable
vs. unshielded twisted pair, it has the additional advantage that a
hub is not required.

Go to a heating and air conditioning supply house or a heating and air
conditioning contractor. They sell mineral oil in 150 and 300 viscosity
for around 8-12 dollars a gallon.
I have used this in high voltage transformers.

4628. FS: Pair of 813's Amplifier in WNC

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-04 00:00:00 UTC
From: techham@my-deja.com
Message-ID: <82b033qal1@nnrp1.deja.com>
Source record: 65094

I constructed this amplifer about 7 years ago....a labor of
love..pictures available. three(3) meters, grid/plate/HV...covers 160
to 20 Meters as constructed, could go higher if desired...B&W switching
networks, 3200 volts approx...works fine; neutralized... I have seen
900 watts out on this amplifier... pickup only, Asheville NC or dropoff
in Va or possibly/nearby TN/NC. $165....John W4QCF

Not necessarily. I just set up one of those at home a couple of weeks ago. Those NE2000 compatible cards are dirt cheap (under $20), recognized by every plug & pray system on the planet and plenty fast for home use. Not to mention that as VHF operators, we're probably sitting on the largest collection of BNC connectors on the planet :-)

Hi! I have for sale a heatkit HF station,SB-401 & SB-303
with all the cables and manuels.The transceiver SB-401 needs
repairs,I turned it on a few days ago and I saw smoke coming
out from under the chassie,since then it does not transmit.
I didn't really try to fix it because my electronic skills
are very poor.The receiver SB-303 works really good.
Both pieces are very clean.I bouth them last year and
paid $450.00 for them,I will sell them for $250.00 obo...
If interested,email me direct...Thanks...Eric....73

I have an opportunity to pick up a VM-4 modulation transformer from a friend who isn't planning to do anything with it. I know it is rated for 300 watts, but I was wondering if it could be pushed to about 450 watts or so without distortion.

I'd like to hear from anyone who has experience with this unit.

thanks
Cliff

4641. Re: UTC VM-4 Modulation Transformer Advice Needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-04 00:00:00 UTC
From: Bob <balbert@cnmnetwork.com>
Message-ID: <eQf24.115321$y45.2163017@news4.giganews.com>
Source record: 65107

There are several factors which determine how much power a transformer can handle. First there is the issue of wire size. If you put a lot of current through a wire it will get hot; the temperature rise depends on the square of the current, the resistance, and the thermal transfer characteristics.

Second there is the issue of high voltage; in most cases you can neglect that if you aren't pushing it a whole lot above its ratings. Listen for arcing and look for erratic waveforms.

Duty cycle is another factor. If the transformer is rated for CCS (continuous commercial service) it will handle short peaks of much more than its rating, especially if it hasn't been operating at full rating. In other words, speech is much safer than music and steady tones are the worst, especially if they are closer to square wave than sinusoidal. And you can hit it with a very large peak if it hasn't been operating at full rating up to that time.

Core saturation can be a problem. If you limit the low frequency content in direct proportion to the power handled you can succeed there also. If you have a push pull driver, it's wise to balance currents carefully so that there is minimal dc component of current in the windings. An oscilloscope current probe on the primary winding can show you the point of saturation by the presence of a much higher peak current at one point of the wave. Most audio transformers are built with 'soft' iron that won't saturate abruptly so in general you won't have a major problem. But realize that the magnetizing current increases faster than the primary current, and while a core won't fail, the windings will.

You can't really tell how hot the interior of the transformer gets by measuring its temperature rise; there might be small points of very high temperature, depending on how well the unit has been impregnated after winding and how neatly it has been wound. Measuring winding resistance change has the same pitfall; a burnout occurs at a tiny hot spot that can't be identified from outside a sealed unit.

Most transformer ratings have a reasonable safety factor, maybe 10% or so. Also consider the ambient temperature; if it's rated at 40C and you keep the ambient at 30C or lower you can drive it harder. You can also cool the unit somehow: blow cool air over it, submerge it in low temperature oil, put it in a refrigerator, and so on.

And so the answer to your question is that there is no pat answer. You can try to overdrive it, noting the factors above, but there is the risk of burning out a winding. Once you do that, it's junk unless you want to disassemble it and repair it (which I have done). In many cases, a winding will fail near its termination but you never know.

Good luck, and tell me how you make out.

73, Bob K6DDX

P.S. Excuse the $25 answer to your $1 question....

It always amazes me when I look for an old ad that I was sure was quite
common, how many magazines I have to look through before I find the ad
I need.

Anyway, QST for May 1968 has an ad for the HW-18, inside the back cover.

"200 watts PEP on 160 meters for $109.95
New Heathkit HW-18 series 2-channel SSB transceivers for
160 meters, MARS & CAP"

Some of the features listed include:
-200W PEP SSB
-25watts input with carrier for AM compatibility
-fixed tuned for easy PTT operation
-automatic level control
-clarifier control adjusts transceive frequency
-relayless transmit-receive switching
-local-distance switch prevents receiver overload
-12 tube circuit, 17 tube function
-operates mobile or fixed with HP-13 or HP-23 power supplies

HW-18-1
for CAP
4450 to 4650KHz
USB
clarifier range: +-100Hz
selectivity: 2.7KHz @6dB, 6KHz @ 50dB

HW-18-2
for MARS
4450 to 4650KHz
LSB or USB (but I guess this may be determined by the local oscillator)
clarifier range: nolisting
selectivity: 2.1KHz @6dB, 7KHz @ 60dB

HW-18-3
for 160meters
1800 to 2000KHz
LSB
clarifier range: +-250Hz
selectivity: 2.7KHz @6dB, 6KHz @ 50dB

Common specs
sensitivity: 1uV input provides at least 15dB signal to noise ratio
intermediate frequency: 3395KHz
image rejection: 100dB
IF rejection: 50dB
receiver audio output: 1Watt
unwanted sidband suppresion: 45dB min below peak output
carrier suppression: 45dB min below peak output

power requirements:
+800VDC @ 250mA
+250VDC @ 100mA
-130VDC @ 5mA
12,6VAC or 12.6VDC @ 3.75A

I remember one article in 73 where someone added a VFO, though I
can't remember which model; it was someone overseas, so either it
was the 160Meter version, or they were using one of the others on
80Meters. I thought he described an external one, but I also have
a picture of a multi-turn dial where the clarifier control went, so
he must have also tried a built-in VFO.

Any old Handbook will show you how to apply a VFO signal to a crystal
oscillator. I don't remember ever seeing a schematic or block diagram,
so I can't be sure, but considering the low cost, I'd bet that it's
only a single conversion transceiver. So the signal frequency plus
or minus the IF will tell you where the crystal or VFO needs to be.

>constructed to house that mass then perhaps not such a problem as you
>discribe.
The problem with a peltier cooler is that though heat is pumped with
modest efficiency they are lousy insulators therefore if there is no
temperature difference quite a lot of heat is pumped with out too much
current .
The only way to get a low temp is with cascaded junctions this increases
insulation and reduces temperature difference per stage.
Cascaded junctions are available commercially and look like little
pyramids.
Your GaAs chip can sit on top of the top pyramid and can run at -10 but
not at -100C.

Clearly with such a bad insulator theres no point in a dewar flask.

> of thinnet and daisy chaining PC's are gone:-(

--> I think it's the same speed as 10baseT, but slower than 100baseT of course. There is no such thing as 100base2.

When setting up a 10base2 network, remember that the daisy chain must be terminated at each end, and the shield should be grounded at one AND ONLY ONE end. The cable connectors on the cards float, they aren't grounded.

You may be interested to know that there's shielded CAT5 cable available for added RFI protection in 10baseT and 100baseT networks. The shield of this should probably also be grounded at one and only one end, to avoid ground loops.

NEWSLINE 1164

Newsline report number 1164 for release on Friday, December 3rd, 1999 to follow in

5-4-3-2-1.

The following is a Q-S-T. The F-C-C refuses to expand the scope of P-R-B One, enforcement action steps up once again and guess
where most of the hams in the U-S-A live. These stories and more on Newsline report number 1164 coming your way right now!

(Billboard Cart Here)

**

FCC TO ARRL: NO EXPANSION OF PRB-1

If you live in a condominium or other housing with deed restrictions, you will not be getting any assistance from the F-C-C that will let
you put an antenna on the roof. This as the regulatory agency turns down a bid from the American Radio Relay League to expand
the scope of federal preemption over Amateur Radio operations. Newslines David Black, K-B-4-K-C-H, has the details from our South
East bureau:

The FCC hands the A-double-R-L a setback. The League had
wanted the Commission to strengthen PRB-1. That's the federal
pre-emption over state and local ordinances which restricts amateur
radio towers.

The League wanted the FCC to in effect declare any restrictions
Limiting amateur radio antennas to heights below 70 feet as
Unreasonable. The only exceptions would have been if the state
Or local authority could show that the restrictions were necessary
For health, safety or aesthetic reasons.

But the Commission says NO to the League's request, saying its
existing policy with PRB-1 is sound. And, the agency says, it would
be neither prudent nor appropriate to set a height standard
for amateur radio antennas and towers. The FCC also says it does not
want to impose specific rules that local governments must include in
zoning ordinances.

The League had also asked the FCC to clarify that local governments
should accommodate ham antennas, rather than balance local
interests against federal interests involving effective public service
amateur radio communications. And, A-double-R-L wanted the

Commission to pre-empt what it called overly burdensome conditions and high costs that localities might require involving amateur radio antenna installations.

The Commission says its previously set standards have worked relatively well.

>From Birmingham, Alabama, David Black, KB4KCH, for Newsline.

The ARRL Executive Committee was scheduled to review this FCC order at its December 4 th meeting to determine what further
action is appropriate. That meeting should be taking place about the time that this newscast goes to air. (From ARRL Bulletin)

**

THE NUMBERS ARE IN

Over one sixth of all United States ham radio operators reside in a single state. According to the latest statistics published by Fred
Maia in this W-5-Y-I Report, California now plays host 103,365 of the nations 676,737 licensed radio amateurs.

But that's not all. California is also the home of the largest concentration of code-free Technician class hams to be found anywhere in
the continental United States or its possessions. That number is 37,157 with another 20,172 holding the 5 word per minute
Technician Plus ticket.

And would you believe that California also has a larger number of Novice class operators than it has Extra class? The number of
Novices stands at 10, 019 while the Extra class is only 8,826. 13,649 Advanced class operators round out the states total.

Not surprisingly, the place with the second largest ham radio population is Texas. Some 40,915 people hold licenses in the Lone
Star State. And again the most popular license is the code free Technician class with 12,391 holders of that ticket. That's followed
by 7790 Technician Plus holders, 6,960 Advanced class, 6,581 Generals, 4,994 Extra's and 2,199 Novice licensees.

Third place goes to Florida with its 39,941 hams, followed by New York with 32,820 license holders and Ohio with 30,063. The
lowest ham radio population in the 48 contiguous states turns out to be Delaware with only 1,389 but even that's quite a bit compared
with the District of Columbia. There only 414 citizens hold licenses of which 101 are General class.

The smallest ham population in a United States administered territory is the U-S Virgin Islands with a ham radio population of 301.
And for those of you wondering about the far North-West, the state of Alaska is holding its own with 3,169 hams. (W5YI Report)

**

ALASKA RESCUE

And from Alaska, word that three fishermen are alive in part do to ham radio. According to news reports, a Coast Guard helicopter
plucked two brothers and another person from the Gulf of Alaska after their boat sank.

The Coast Guard got its first report of the incident from an unidentified ham radio operator. Soon afterward, the distress beacon from
the fifty-two foot vessel was picked up by the Coast Guard stations at Juneau and Sitka

About 90 minutes later, a helicopter found the three fishermen in the icy water. All were wearing survival suits but were suffering from
mild hypothermia. By that time their vessel had sunk in twenty-five foot high seas in a fishing area about 70 miles southeast of
Yakutat. This is a region known for its fierce winter storms. No other information was given regarding the part played by Amateur
Radio in this rescue at sea. (Published news report)

BREAK 1

This is Newsline, heard on bulletin stations around the world, including the W-B-5-R-A-P repeater serving Purcell Oklahoma.

(5 sec pause here)

**

ANOTHER WIDE SIGNAL WARNING ISSUED

For the second time in as many weeks, the F-C-C has told a ham that he is transmtting an excessively wide signal. In a November 2
nd letter to Charles Schwartzbard, A-F-2-Y, of Clifton New Jersey, the F-C-C says its monitoring information indicates that he has
apparently been operating his station in a manner that causes it to emit an unusually wide signal, one that is over-power, or both.

Specifically, the F-C-C alleges that instances of these violation occurred on November 17 and 18 th in the frequency range of 14.315
to 14.318 MHz. The Commission also says that its Information further indicates that Schwartzbard ignored requests from other
licensees operating on adjacent frequencies to correct his transmitter emissions in accordance with good Amateur practice.

The Commission has directed Schwartzbard to answer--- in detail ---several technical questions pertaining to the way he operates his
Amateur station. A-F-2-Y was also cautioned that airing personal conflicts with other licensees on the Amateur bands, or slander or
deliberate interference to other licensees will result in the loss of Schwartzbard's Amateur license. (FCC)

**

HOLLINGSWORTH TO SPEAK IN DAYTON

And while on the subject of Amateur Radio enforcement, the Dayton Amateur Radio Association has announced that the nations top
ham radio rules enforcer will be the featured speaker at Hamvention 2000. According to DARA, F-C-C Special Coulsel for Amateur
Radio Enforcement Riley Hollingsworth, K4ZDH, has accepted an invitation to keynote the combined 2000 Dayton Hamvention and
ARRL National Convention Grand Awards Banquet next May 20th. (DARA)

**

VIRGINIA MAN INDICTED FOR OPERATING AN UNLICENSED FM STATION

A Virginia man has been indicted for running an unlicensed broadcast station. According to Bob Gonsett's C-G-C Communicator
newsletter, The FCC Enforcement Bureau announced that on November 16, a grand jury serving the U.S. District Court in Richmond
had indicted Khalid Kubweza, on four counts of operation of an unlicensed FM broadcast. Kubweza is accused of transmitting on
91.7 MHz from his Richmond home. (CGC Communicator, FCC)

**

RMARC REPEATERS TEMPORARILY DOWN

If you are traveling into the North-East, some repeaters that you may rely on will not be there for a while. This with word that the
Ramapo Mountain Amateur Radio Club's repeaters on 146.49 and 446.175 MHz and the club's A-P-R-S digipeater on 144.39 MHz,
are temporarily off the air.

According to Joseph Jack, WB2WAB, the machines were turned off on November 15th for maintenance and repair. No date has
been announced for when they will be returned to service, but full operation will resume as soon as possible. The packet digipeater
on 145.01 MHz is not affected and will remain in operation. (Hudson Loop)

**

THE LOW COST HAM AID BOX

Repeater owners and trustees might want to take note of a very intriguing article by Bob Bruninga, WB4APR that appears in the Fall
1999 issue of Amateur Television Quarterly magazine. Its called the Ham Aid Box and Bruninga says that it's a way to distribute text
messages using an off the shelf piece of consumer electronic gear..

According to WB4APR, the caller I-D units that many of us have in our homes use the same 1200 baud ASCII and Bell 202
standards as used on packet radio. He goes on to say that a caller I-D unit hooked to the speaker of a mobile or base ham radio
station can display up to four lines of text messaging. Since all caller I-D units have memories, multiple messages can be stored.

The text message would have been generated by any ASCII capable T-N-C connected to the repeater. Bruninga says that this could
make it possible to implement a universal and low cost amateur radio text distribution system -- almost overnight. (WB4APR Internet
Posting)

**

REPEATER SITES: WHAT HAMS ARE DOING

A few weeks ago we told you of the problem of retaining sites for ham radio repeaters in light of consolidations in the tower
management business. As more and more radio sites come under the management of a small number of mega-corporations, free --
or low price radio sites for hams are quickly disappearing. And there have been reports of the mega owners doing all within their
power to keep experimenters like hams off hilltops and roofs that they share with other site administrators. As a result some ham
radio repeater operators have taken the extreme alternative of buying property and putting up their own sites. In part two of our series
on the repeater site crunch, Newsline producer Bill Pasternak had the chance to chat with a ham who has done just that:

I first met Frosty Oden, N6ENV, almost two decades ago. Along with Roy Neal, K6DUE, Frosty and I were the
people who brought you the video about Owen Garriott's first ever ham radio mission into space -- Amateur Radio's
Newest Frontier. By that time, Frosty had his first repeater on the air and he has been involved in V-H-F and U-H
F relay communications ever since. But unlike most other ham radio system owners, Frosty Oden is also the owner
of the site that hosts his systems. We asked him why he decided to make such a large investment for a hobby:

SOT:

In-Q: When you are a tennant...
Out-Q: ... look on their face.

Oden says that these were among the reasons that he decided to cut through the red tape and invest in a
mountaintop home for his repeaters. He also realizes that not every ham can afford the luxiary of site ownership.
His advice: Take a lesson from the professional two-way people and consolidate:

In-Q: If a group of Amateurs...
Out-Q: ... vault space for the Amateurs.

We asked Oden what he sees for ham repeater owners in the future. He admits that he is far from optomistic:

In-Q: The big problem is ...
Out-Q: ... out of luck.

Oden says that the best way for hams to survive the coming repeater site crunch is begin pooling our resources
and learning to share.

> For Newsline, I'm Bill Pasternak, WA6ITF

-----
unfortunately, more and more hams are now finding that the same mega-managers that evicted them from where they had been are
also filing in opposition to building permits and even challenging land sales. They don't want hams near their sites for fear of
interference from Amateur Station equipment and the possibility that some ham radio clubs might decide to rent their excess space
to commercial customers. We will deal with this part of the story in a future Newsline report. (Newsline)

BREAK 2

Serving you 52 weeks a year since 1977, this is Newsline, with links to the world at www.arnewsline.org.

(5 sec pause here)

**

SOLAR MAXIMUM COULD ZAP POWER GRIDS

Communications satellites and power grids could be disrupted for the next three years because of intense solar activity associated
with the upcoming Solar Maximum. Newsline's Bill Burnett, KT4SB, reports from Miami:

According to a report on the program This Week in Amateur Radio that in tuirn quotes other published news
reports, starting in the year 2000, space storms, radiation showers and their affects on power grids are all
expected during the upcoming maximum, which is expected to last about three years. And, according to
administrators at the National Oceanographic and Atmospheric Administration, the United States is especially
vulnerable because of its increasing dependence on satellites.

National Ocenaographic and Atmospheric Administration officials say that these storms act to alter the Earth's
magnetic field. Because of this, they may send strong enough electrical impulses that could

overwhelm vulnerable power grids.

One of the strongest impacts occurred during the last solar cycle in 1989. Thats when the entire Province of
Quebec in Canada went dark because a geomagnetic storm caused a power grid overload.

To prepare for the possibility of a more widespread problem, NOAA scientists are using state-of-the-art scales
designed to depict the severity and impact of upcoming solar storms on public safety and vital services.

And while amateur radio operators await the solar maximum hoping for improved conditions on all High Frequency
and V-H-F band conditions others are at work in another important area. They are getting their emergency
communications equipmment and back-up power systems ready -- just in case.

>From Miami, I'm Bill Burnett, KT4SB, reporting for Newsline.

By the way -- a quick note concerning the This Week in Amateur Radio program. Word that it is moving to a new C-Band domestic
satellite effective as of Saturday, December 4th. Look for the program on T-V-R-O Net on G-E Americom Spacenet 4, transponder
16 Horizontal. The program audio will be on the satellites 5 point 8 MHz wideband analog subcarrier. (TWIAR, NOAA)

**

ARIANE 5 LAUNCH DATE ANNOUNCED

And with another kind of satellite news, Arianespace has now scheduled the first commercial launch of its new Ariane 5 heavy lifter
for December 10th. According to a report from the Amsat News Service, this Ariane flight will carry a European Space Agency
scientific satellite to orbit. W8GUS says that the rocket has been moved to the launch location and a rehearsal has been completed.
(ANS, W8GUS)

**

SUNSAT AWARD

There is a new worldwide ham radio award for using a satellite that is already in orbit. Jeramy Boot, G-4-N-J-H, reports from
Nottingham in the U-K.

PKG Here

Again that address is the Southern Africa Amsat, Post Office Box 1842, Hillcrest, 3650, South Africa. (G4NJH, S. AFRICA AMSAT)

**

FIRST IRISH ATV REPEATER

The Republic of Ireland has it very first fast scan amateur television repeater and a sightless ham is responsible for making it happen.
Roy Neal, K-6-D-U-E, has more:

The Cork Amateur Television Group has been granted the first Fast Scan TV repeater license in the Republic of
Ireland. The callsign of the new TV Repeater is EI2TVR and it operates in the 23cm band.

What is unique about this project is that it was put together and set up by a blind operator, Aedan O'Meara,
EI3EG. It was only in the last year that Aedan became interested in this mode and set about getting all the
necessary information both from Ireland and the U-K. The transmitter was designed by the West Sussex ATV
group. The frequencies in use are 1250MHz for the input and 1293MHz for the output.The repeater is presently
located on Spur Hill in Cork, which also houses the Cork 70 cm voice repeater.

> Roy Neal, K6DUE.

According to reports, the EI2TVR repeater is fast becoming a popular meeting spot for hams interested in fast scan A-T-V.

**

DX

In D-X, keep an ear open for Malawi as ZS5BBO will arriving on or about December 19 th. He will be there until December 26 th and
plans to be active from the shores of Lake Malawi, signing 7-Q-7B-O. Listen for Edwin on 10, 20, 15 and 6 meters. All QSL cards
must be accompanied by an S-A-S-E Edwin Musto, P.O. Box 211032, Bluff, 4036, South Africa. (OPDX)

And the DX News Letter says that DL7FER, is expected to be in Sri Lanka until Christmas. He will operate CW and SSB on 40
through 10 meters including the W-A-R-C bands. His Q-S-L go direct or via the bureau to DL7FER. (OPDX)

Lastly, Panamanian amateurs will be allowed to use the special prefix 3-F between the 1st of December 1999 and the 5th of January
2000 This, to celebrate the Republic of Panama's acquisition of the Panama Canal. HP1AC will be active on C-W as 3F1AC, and
QSL's should go to P-O Box 0860-00144, Villa Lucre, Panama. (OPDX)

**

THANK YOU CHUCK MARTIN, KD6NUJ

And finally, It is no secret that volunteerism is one activity that binds the Amateur Community together. It's central to Newsline's
existence.

In the more than 20-years Newsline has been on the air, volunteers -- often without our knowledge -- have contributed to our success.
During the first station break in each Newsline report, you hear us acknowledge bulletin stations by name, that feature our Amateur
news service.

This week, as we conclude our 1164th newscast, we want to pause to recognize a Ham: Chuck Martin, KD6NUJ. Chuck is the
individual who recorded and encoded our weekly QSTs in Real Network's streaming audio format. He then posted them on Tucson
Amateur Packet Radio's web site -- each week -- since report #962 on January 21, 1996.

As we approach the new millennium, we would recognize Chuck's contributions
for nearly four years of service. Unfortunately, Chuck's home and Ham Shack suffered severe flood damage last September when
Hurricane Floyd struck the Eastern Seaboard. Although KD6NUJ has attempted to keep his personal commitment to Newsline's
Internet listeners, he comes to the realization that this IS only a hobby and he needs to focus on returning his life and his lifestyle
back to normal.

So we at Newsline want to pause and say thank you Chuck. Thank you for your volunteerism and your dedication, and wish you the
best "73."

TAPR's webmaster Greg Jones, WD5IVD, assures us that Tucson Amateur Packet Radio remains ready provide a streaming audio
home for Newsline, but that it may be a bit spotty until we get someone to assume the duty on a regular basis. In the meantime, a
downloadable version of each weeks Real Audio file will continue to be available at Hank Armstrongs F-T-P site which can be reached
from a hot-link on our website at www.arnewsline.org.

**

CLOSE

With thanks to the ARRL, the C-G-C Communicator, the F-C-C, the Hudson Loop, the Radio Society of Great Britain, This Week in
Amateur Radio and Australia's Q-News, that's all from the Amateur Radio Newsline. Our web page is at www dot a r newsline dot org
and our e-mail address is newsline at a r newsline dot org. The address for the Newsline support fund is Newsline, Post Office Box
660937 in Arcadia California. The zipcode is 91066.

For now, with Bill Pasternak WA6ITF at our editor's desk, Im Mert Garlick, N6AWE, saying 73 and we thank you for listening.

Source record: 65123

Hi Steve,

My setup is a Pentium running 95 and a 486-50 running 95 or Linux. I did the following steps:

1. After the cards and cables were physically installed, booted into DOS and used the setup/diagnostics that came with the cards. For the Pentium I left the card in plug & play mode, for the 486 I disabled plug & play and used the suggested port and IRQ settings from the setup/diagnostics program.

2. Ran the DOS-based diagnostics to verify that packets could be successfully passed.

3. Now that I knew that the physical stuff worked, I booted both machines into 95. The Pentium successfully detected and installed the plug & play card with no intervention on my part. For the 486 I ran the hardware installation applet and specifically told it that I had an NE2000 card. Once it was installed, I had a hardware conflict, so I got into the device manager and changed the resource properties for the card so that it matched the ones assigned by the DOS-based setup/diagnostics.

4. Finally, I rebooted and logged into both machines. The network neighborhood showed the current machine on each one, and after about 30 seconds the remote machines showed up.

So, my suggestions are:

Disable plug & play for the troublesome machine if you can.

Use the DOS-based diagnostics if you have them to verify that everything works before you get into OS issues.

Use the 95 help file's "Troubleshooting" section to try and figure out why you get the startup message. Most probably a configuration problem with a conflicting IRQ in my experience. Good luck,

73 de KF4PV/3, Laszlo

4660. Silver Mica caps

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-05 00:00:00 UTC
From: Harold Johnson <w4zcb@earthlink.net>
Message-ID: <82e341$q5o$1@birch.prod.itd.earthlink.net>
Source record: 65126

OK, let me try again. Looking for some silver mica caps, 500 volt rating, and values in the range of 100 to 2000 pF. These are physically 5/8 by 1/2 inch in the higher values of capacity.

>
> Pls advise.

I was in Shanghai recently. The power is 220VAC 50 Hz. If you're
traveling with a late-model notebook computer, its power adaptor
is probably good for 90-250VAC 50/60 Hz ... (my 4 year old
Toshiba Tecra 700CT worked fine.) The plugs in the hotel
fit my standard 2-prong plug on the notebook's adaptor.

As far as telephone is concerned, I found standard RJ modular
jacks ... in fact, in the hotel, the phone on the desk in my room
had a data/fax jack.

However, don't expect 56k ... the best connections I got were
24k ... 19.2 was not uncommon ... the lines leave something
to be desired.

Have a nice trip ... enjoy the food.

73,

Carl - wa6vse

> current .

The whole factor about Peltier devices is the geometry.
I envision a device buit directly onto a peltier cool with a concentric
spheres type of construction the cooling current being run in series perhaps
if the physics permits. Reversing the current turns the device into a good
heater.

> The only way to get a low temp is with cascaded junctions this increases
> insulation and reduces temperature difference per stage.
> Cascaded junctions are available commercially and look like little
> pyramids.

I think that they should be concentric spheres.

> Your GaAs chip can sit on top of the top pyramid and can run at -10 but
> not at -100C.
>
> Clearly with such a bad insulator theres no point in a dewar flask.

I think it is the bad geometry of a pyramid that is to blame here.
Even so if heat from te room is prevented from entering the zone to be
cooled that is work the the Peltier device does not have to do.

The old symbol for Current was 'C' just substitute I and you will readily
recognise Joule heating due to I^2 R in the following:
Extract from "Magnetism and Electricity for Students" H E Hadley BSc
(London) Associate of The Royal College of Science London, Headmaster of The
School of Science, Kidderminster, Publisher Macmillan & Co. Limited St
Martins Street London 1908
==========
The Peltier Effect
When one junction of an antimony/ bismuth couple is heated, the current
flows through the hot junction from bismuth to antimony (Fig. 261). Peltier
observed, in 1834, that if both junctions are at the same temperature, and

if a battery is included in the circuit so as to send a current in the same direction as before, then heat is absorbed at the junction T, and generated at the junction t. Also, these heat effects are reversed when the direction of the current is reversed. This is termed the Peltier Effect. It is quite independent of the heat generated according to Joule's Law, which is equal to C2Rt:

It can therefore be most readily observed by using thick bars of metal in which the Joule effect will be a minimum. Fig. 262 represents the method adopted by Peltier to observe the effect, in which two rods of antimony and bismuth (11 cms. long and 16 sq. mms. cross-section) are soldered together to form a cross. If a current is sent across the junction in the direction of the arrow, the deflection of the galvanometer needle will indicate a thermo-current across the junction from antimony to bismuth, showing that the junction is cooled.

EXPERIMENT 75 -- Connect together, as shown in Fig, 263, a battery B, commutator C (with diagonal wires removed), thermo-pile TP, and a low?resistance galvanometer G. Pass a current through TP for a short time, and quickly reverse the commutator so as to cut out the battery and complete the circuit through G and TP. The observed deflection will indicate a current through TP in a reverse direction. By varying the strength of current from the battery it may be shown that the tbermo-current is approximately proportional to the battery current.

The Peltier effect may be explained if we assume that there is, at a junction of two metals, a sudden change of potential which is independent of the potential changes due to the battery. Thus, if a current traverses the junction represented in Fig. 264 from left to right, heat will be generated at the junction since the current will do work in traversing a fall of potential. If the direction of the current is reversed beat will be absorbed to an amount equivalent to the work done in overcoming the rise in potential. The mechanical equivalent of the heat generated or absorbed by a current of strength C in 1 second is given by the equation

JH = (V1 - V2) Ct = PCt.

The Peltier coefficient P Is defined as the energy generated or absorbed at a junction of two metals traversed by unit current for unit time.

(JH)=C2Rt+PCt

In any portion of a circuit, of resistance R, which includes a single thermo-junction, the total energy generated when the current is in one direction; but if the current is reversed the total energy

(JH') = C2Rt - PCt

The value of the coefficient P is determined by measuring the difference between the above quantities, thus

P= J (H - H')/Ct

Le Roux adopted the method of Fig. 265 in order to measure the Peltier coefficient. A and B are two antimony/bismuth couples, the shaded elements being antimony, immersed in water contained in two calorimeters.

On passing a current of known strength through the circuit for a given time, the heat developed in the calorimeters is given by the equations

Hl = w1t1, and H2 = w2t2

(where w1 and w2 are the water equivalents of the calorimeters and contents,

t1 and t2 the observed rise of temperature).
If Q1 and Q2 represent the heat due to the Joule effect in the two cases, also P1 and P2 the Peltier heat effect, then
H1 = Q1 + P1, and H2 = Q2 - P2.
If a current of the same strength is now passed in the reverse direction for the same time, then
H1'= Q1 - P1, and H2' = Q2 + P2
Hence Pl = (H1 - H1') / 2, and P2 = (H2' - H2) / 2
But Pl = P2, therefore P = (H1 - H1' + H2' - H2) / 4
Le Roux found that the value of P for any couple is proportional to the thermo-electric power of the couple, and also that the value increased with increase of temperature.
More accurate results have been obtained by Jahn (1888) by measuring the heat developed when the junction is enclosed in a Bunsen ice-calorimeter. The Joule effect was eliminated by repeating the observation when the current was reversed.
Thermodynamics of the Peltier Effect
Consider the case of a single antimony/bismuth couple, with the junctions at 100°C. and 0°C. Heat is absorbed at the hot junction, and is generated at the cold junction; moreover, these effects are reversible. The current which is generated will also develop in the circuit a quantity of heat proportional to C2Rt: this is independent of the direction of the current and is therefore irreversible. The whole cycle of operations is therefore not reversible. But if we assume the circuit to have so low a resistance that the Joule effect is negligible, and that the circuit includes some mechanism, such as a perfect motor, which will convert all the electrical energy into mechanical work, then the cycle of operations may be regarded as completely reversible ; for, if the junctions are initially at the same temperature, and if the motor is rotated in the opposite direction, a reverse current will be generated which will produce reversed heat effects at the junctions. With this assumption the circuit is comparable to a perfect heal engine,' in which the ratio of the heat absorbed to the heat given up to the condenser is equal to the ratio of the absolute temperature of the source of heat to that of the condenser. Hence, if P1 and P2 are the mechanical equivalents of the heat absorbed and liberated at the hot and cold junctions respectively when unit quantity traverses the circuit, P2 / P1 = T2 / T1, where T2 and T1 are the absolute temperatures of the junctions ; or,
(P2 - P1) / P1 = (T2 - T1) / T1, or E = (T2 - T1) P1 / T1
According to this result, the E. M. F. would be directly proportional to the difference of temperature of the Junctions, which is contrary to observed facts. This process of reasoning led Lord Kelvin, in 1851, to predict the existence of reversible heat effects in other parts of the circuit besides the junctions. He afterwards demonstrated, when a current flowed through unequally heated conductors, that heat was generated in some cases, but absorbed in others; thus, a current through iron from a hotter to a colder part is accompanied by absorption of heat, while. the same conditions in copper are accompanied by generation of heat. This is known as the Thomson Effect.

==========

As you can see the physics is not exactly new just the technology that still has a little way to go.

```
I have the following RF Amplifier parts to sell;
================================================
4-1000 Tube with finned Aluminum Plate Cap $100
------------------------------------------------
Oil Filled Capacitors;
[QTY 1] 53 MFD @ 3.5 KV $30
[QTY 2] 8 MFD @ 4 KV $15 ea.
[QTY 3] 2 MFD @ 3 KV $10 ea. (NEW!)
[QTY 2] 24 MFD @ 1 KV $10 ea. (NEW!)
[QTY 1] 4 MFD @ 600 V $5 (NEW!)
[qty 2] 2 MFD @ 600 V $5 ea. (NEW!)
*Take all the above for $100
------------------------------------------------
Brand New Peter Dahl 30AMP Filament Choke $25
------------------------------------------------
Sangamo Type GLB Ceramic Mica DC Blocking Caps;
(Big Commercial type with cast aluminum flanges)
(they have 20AMP RF rating at 1000KC)
Have (3) .01 @ 4 KV, .016 @ 3 KV, & .02 @ 3 KV.
$20 ea. or take all 3 for $50 and I'll ship (48)
------------------------------------------------
National Neutralizing Capacitor (1 7/8" dia.)
(~1/16-1" adj.) has venier drive with lock. $20
------------------------------------------------
Blower 115VAC - 2960RPM - 3" ID round air inlet.
2 1/2" Sq. Outlet w/3"BoltCtr flange mount. $30
------------------------------------------------
19" Rack Panel Cabinet has 35 1/8" total front
Panel opening space. Cabinet is overall 23" Wide,
44" High, 24" Deep, has front and rear mtg rails,
Removable rear door by just lifting up when open,
Custom made bolt-on White Formica Top, Nice cond.
Removable wheels and level adjusters. $100
------------------------------------------------
ALL ITEMS PLUS SHIPPING (at cost) K9RB@arrl.net
Roger Borowski-K9RB (near Jacksonville, Florida)

I have a oil filled cap, with two insulated posts, and no polarity marks anywhere.
Do these units have polarity, or are they non-polarized?

Here's a great noise circuit

Purchase a spark gap generator, a.k.a. Model T ignition coil, mount a 10 penny nail on an insulator inside a coffee tin, at right angles to the base of the can. Connect spark generator to nail, ground to tin. Generate spark and watch the mcw RFI!

Guaranteed to knock out X and K band radar units, will probably wreak havoc with cell phones too.

This, by the way, is in the spirit of jest, and probably apocryphal legend.

There is no simple answer as there are many types of relays and
similar types often have different pinouts. What kind do you have and
what are you wanting to do with it?

I don't believe there is any standard to relay pinouts.

It should be easy enough to figure out with a multimeter. The coil will exhibit a resistance, which an Ohmeter should be able to find. As for the NC, NO and COM. Well, you can find the COM and NC easily enough so just energize the relay and find the COM and NO.

MC

Have I hit a time warp ? It was an excellent receiver when it came out about
3 years ago. The performance is excellent for the price. The software is
even less useful than windows 98 but there are alternatives.

Dave Martindale (davem@groucho.cs.ubc.ca) wrote:
: Jim Adney <jadney@vwtype3.org> writes:

: >>Lighting operated from 25 Hz power
: >>flickers at 50 Hz, which is visible.

: >A flicker rate of 50 Hz is commonly spoken of as being annoying, but
: >it is well above that of modern theater projectors, which I believe
: >run at 16 frames/sec, projecting each frame twice for a flicker rate
: >of 32/sec. I haven't run into anyone yet who is annoyed by the flicker
: >rate of a modern movie.

: 16 and 18 FPS were used for movies in the silent period, but sound
: movies run at a standardized 24 FPS. With the usual double-flash
: projector, this results in a 48 Hz on-screen flash rate. The eye's
: sensitivity to flicker depends on lighting levels, and at the relatively
: low light levels in movie theatres within the image areas, 48 Hz flicker
: is *usually* not visible.

: However, the eye is more sensitive to flicker in its peripheral vision
: than it is in the central area (fovea), and movies sometimes have
: large areas. that are significantly brighter than the
: average image level. When all of these factors combine, for example
: if there are bright clouds in the sky but you're looking at something in
: the foreground, audiences sometimes *do* see flicker in standard movies.

: To avoid this, triple-flash movie projectors have been built; the 72 Hz
: flash rate *is* invisible regardless of scene content.

: Computer displays are much brighter than movie screens, so they
: have to be operated at higher frequencies to avoid flicker - as high
: as 72 Hz in some cases. 48 Hz flicker on a CRT is definitely visible
: at normal room light levels.

: Now, light bulbs are even brighter than CRT displays, and are also
: more often in the peripheral vision, so this is probably the worst
: possible case for seeing flicker.

: >In addition, incandescent bulbs have enough thermal mass that they
: >really don't cool down that much each cycle, so there really isn't
: >much flicker to them.

: Have you ever seen a light bulb driven by 25 Hz? I haven't myself,
: but I have heard of the flicker.

: In addition, I've measured the flicker produced by a 200 W 12 V halogen
: lamp running from 60 Hz. This is a nice heavy tungsten filament, and

: the ripple in the light output is still a few percent - not enough to
: see flicker, but enough to screw up a CCD scanner. So I'll readily
: believe that a thin 120V filament running at 25 Hz would have much more
: ripple in light output, enough to see.

: >I suspect that the move to higher line frequencies was motivated by
: >the reduction in iron (and consequently weight and size) in generators
: >and transformers.

: I'll agree with you there. It may have also come about because better
: transformer steel became available. Plain iron has losses that increase
: dramatically with higher frequency, so perhaps using higher than 25 Hz
: would have resulted in inefficient transformers. Then silicon steel
: was developed for transformer cores, allowing 60 Hz operation while
: keeping losses low. But I'm too young to have been around at the
: time, so this is speculation.

: Dave
I've seen incandesant bulbs running on 40 Hz...the flicker is quite
noticeable, but not as bad as 25 would be.
On a aside, I walked into a friends bathroom some years back, turned on
the light over the sink, and noticed a distinct flicker....I discoveres
that he had installed "bulb savers" in the sockets(a silicon diode in a
rubber disc that presses into the socket, under the base of the bulb).
So I guess those bulbs were running at 30 Hz(actually, not really-the
"off" period is longer this way).

Love to give you a hand, but that diagram is totally meaningless. Folks should be aware that because of all the different possible settings for fonts, line truncations, etc. (some of which are not controlled by the recipients), diagrams done with character graphics are almost always garbage. Some good alternatives are to use your favorite drawing program (even lowly old Paint will work) to draw a simple image, or to draw the diagram by hand and scan it in. If you're scanning, use a black & white line art mode, not color or gray scale or you may get megabyte-sized files.

Do the world a favor, though, and do not send diagrams as attachments. If you absolutely must attach, use JPEG or zip a BMP. The best solution would be to put the diagram on your web page and just post your question with a URL to the image. If you don't have a web page, another option would be to offer to e-mail the image to anyone willing to help. That way only the interested parties need to download it. And if all else fails, the good old US Postal Service will get a paper copy anywhere in the continental USA in 3 days or less for only 33 cents.

Then there's the other alternative, the detailed verbal description. A relay could be described, for example, as:

Manufacturer's markings are ... (insert numbers and stuff here, maybe describe any logos), size is 3/4 inch long, 0.4 inch wide, .5 inch high, opaque light blue plastic on the bottom half, translucent blue plastic on the top, 4 pins on each long side grouped as 3 close together at one end and a single one at the opposite end, spacings are 0.1, 0.1 and 0.4 inches between the pins.

This kind of description would convey a lot more information than scrambled characters and would be properly displayed by any e-mail program. It would also let some of us notice that it's in a 14-pin DIP package, probably DPDT with the coil being the 2 single pins at one end. And with a good set of manufacturer's markings, it could be possible to go right to a catalogue or the manufacturer's web site and get an actual data sheet.

So, if you haven't gotten your answer yet, use one of these alternatives and repost and I'm sure you'll get a lot more help.

Would that really extend the life of the light bulb? I thought it was
the intial surge of current through the filament (until the filament
heats up and changes resistance) that eventually leads to failure.

Source record: 65065

Greetings everyone,

Since getting my Advanced over the weekend, my interest of radio design is growing (due to the theory that you have to learn to pass it). I am still a beginner than understands the basics, but I would like to experiment a little more. I saw that the ARRL has a nice program that does this, however, I am not willing to pay that much for it at this time. (I wish there was a demo of it to see what it is like.) Does anyone know of any freeware/shareware radio design packages that are available that I can download and try out? Something that would allow me to build a circuit and tweak the components. i.e., what happens when I remove this resistor here? What happens when I change the capacitance here? etc etc. I think this will help me learn more about why a circuit works the way it does.

Thanks es 73

There is no polarization on an oil filled capacitor. Only electrolytic capacitors are polarized.

Using a series diode causes a lamp running on 60 Hz power to flicker
at 60 Hz - instead of the 120Hz that is usually the case. To get 30 Hz,
it would have to pass only every second half-cycle.

Hi,

I'm looking for a schematic of an oscillator which would be variable between 98 and 118MHz. It would be used for a local oscillator of an FM receiver with a IF of 10.7 MHz. I would appreciate if someone could get me or tell me where to get that schematic. Thank you

Andre M. S.

There are many sources of what you seek. Many millions of homes have such oscillators in everything from a jogging radio to a full blown stereo receiver, and of course car radios.

If you want a diagram, pick any unit and get the service information. Hartley and Colpitts oscillators are commonly used. See any handbook for discussion of principles of operation.

These days, tuners are digital, and so these oscillators are controlled by phase locked loops or even have the frequencies synthesized in the more expensive units.

Now that is exciting news.

I have a fairly complete collection up till shortly after Jim Fisk died but then it shifted a bit, I shifted a bit, and for much of the last decade it wasn't readily available here. I've been tempted by the microfiche version, to fill in the missing issues and get things nice and neat. Other magazines, one could take out the "good" articles and discard the rest, but there never seemed to be much filler in Ham Radio. But the microfiche does require that you buy it all at one time, and I've never felt like spending that much for the whole set.

When Ham Radio shut down, and CQ bought the remains, they made a big deal of selling off the back issues. But I also remember that they carried a steep cover price, which is okay to fill in an occasional issue but not conducive to filling in complete years at one time. A while later, I contacted CQ to see if back issues were still available, and I was told that much of what was left had been discarded.
Judging from the price of QST on CD-ROM, I assume Ham Radio on CDROM will be more affordable, if for no other reason than one could buy it in stages.

Jeff...it's probably not trivial to make changes like that. The power gain of a stage with much lower power supply voltage will most likely be much lower. You might consider instead building an inverter power supply that will step your 3v up to 5v and 12v. If you're willing to have a transmitter that puts out way less than 5 watts, it might be practical to use the circuit you have as a starting point.

Cheers,
Tom

Don't know where you would come across 40 Hz, but the flicker rate
from this would be 80 Hz and I don't think anyone has suggested that
you should be able to see this.

>On a aside, I walked into a friends bathroom some years back, turned on

Actually the rate would then be 60 Hz, but at least there is a
significant OFF period between each flicker. Still, I'm surprised that
this can be seen.

Down load the Microcap 6 demo from the site below. The demo is a circuit
analysis program that will do what you want.

Jason OM,

"Radio Designer" software, its name notwithstanding, does not "design radios"
for you. It enables you to enter a circuit description,
and run a circuit analysis of it, to provide you with
information about its operation. You still have to interpret that information.
It does not replace actually building a circuit and learning how to make
measurements on it. It cannot design the circuit for you. To learn how circuits
work, you first need to experiment with proven designs, hands-on. Using a
computer just gets in the way in my opinion.
The computer is most useful AFTER you've assembled and tested real hardware a
few times, so that you can recognize results that are real and possible, from
those that are not. The computer does not make such distinctions, and you will
use up a lot of time just learning how to be a USER of the program, before you
get anything back from it that is instructive for building real circuits.
Save your money for a few components and a VOM, and start with a simple
proven design such as a code practice oscillator or such
circuit from the many examples in ham radio handbooks and literature. I suggest
you NOT buy new handbooks; in my opinion they are very expensive (I would
say overpriced), and you can usually find one at a local library. Save your money
for hardware that is re-usable.
What you need to do first is get familiar with basic circuit operation. All you need is
a cheap volt-ohm-milliammeter (VOM) analog or digital, a couple of flashlight batteries
and a few components for starters. Save the (expensive) computer software for later
on after you have a few projects under your belt.

It is a "Design Aid" that helps to evaluate and refine a design by simulation. And if you learn to use the Circles Utility it can be used to perform a true design process on amplifiers and their impedance matching networks.

Source record: 64997

Rick K. posted good info on doing it with a DBM. If you don't have any spare DBM's around, you can also do it with what's essentially a full-wave rectifier. Feed your signal into a low-Q center-tapped tuned circuit, or even just a broadband transformer with center tapped secondary (or an "autotransformer", 1:1, so it has a center tap). Ground the center tap and connect diodes from each output to a DC load and a low-Q resonant circuit or bandpass filter to pick off the second harmonic, which will be quite strong. Use Schottky signal diodes; don't ask for TOO much power out of them. Account for their capacitance (keep the impedances reasonably low). Oh, and do NOT feed the transformer with a square wave: the output then would be full "high" all the time, with no (very little) AC component. I think this is the same as one of Rick's comments about the DBM, worded a little differently.

You can also do a decent job digitally...xor'ing the squared-up VCO output with a phase-shifted version of itself. Over your limited range, the phase shift should be OK as just a fixed delay, though there will be some rolloff away from the optimal frequency, and also generation of third and other harmonics. 74AC-series of ICs can handle 100MHz pretty nicely.

Assuming you are going to put some power amplification after it, there's an advantage in doubling: the output is less likely to get into the VCO and cause squirrely behavior. -- I trust you will use this responsibly and not muck up my (or others') FM listening pleasure.

Cheers,
Tom

Only household items I can think of would be a automotive battery charger or one of those transformers used for outdoor low voltage landscape lighting. IIRC, those are 24 VAC, with a grounded CT.

Any good electrical suply house should have either a "buck-boost transformer" or a "control transformer" that should work. 24VAC is a common industrial control voltage.

Jason:
Commercial vendors offer evaluation copies of software design packages
from time to time, and often can be downloaded. These downloads are
watered down versions where only a few components can be used, etc.
These packages cannot be too good, or potential buyers would use the
freebes instead of spending big bucks. The watered down package are
usually ok for simpler circuits, but there is another problem.

Unless you are much sharper than me (which could be..), you probably
will find it really difficult to jump into one of these packages cold
and do some worthwhile evaluations.

About a year ago, I downloaded a demo electronic CAD program. It took
about an hour to download Sunday morning when I was receiving data
almost steadily. I ended up with a number of programs and files, and
wondered what to do. I tried this and that, and found one of the
programs seemed to be a good place to start. After a while, I just let
it go, taking up much hard disk space.

More recently, I received an offer through the mail to get Electronic
Workbench at a healthy discount, which I accepted. Once again, I
entered a circuit, and it didn't work. I read their manual and worked
through their examples (their manual provided much hand holding). When

I had big problems, I sent an email to tech support, and received help shortly afterwards. In fact, they even telephoned me. The program wasn't trouble free and tech support was a big help.

Now, that I have my feet wet, I'm going to try the other program again.

If you really want to get into computer aided design, you would be money ahead to start saving and buy something like the ARRL Circuit. Designer. Pricewise, it's a bargain and they don't assume you are a seasoned designer. I can't comment on their tech support, as I have not used it.

The eye can see at least 70 Hz or so, if the source is bright enough.
It also helps for it to be off to one side - your peripheral vision
can see faster flicker than the central area.

That's why many PCs were seen to be flickering with VGA displays
running at 60 Hz, and why PC frame buffers and monitors are now usually
capable of at least 75 HZ - usually more.

>go back to their normal state. So we have a built in charge.

>The word electret means a permanently charged material.

You're confusing two different types of "bias" here.

The electret material itself does have a permanent electric bias built
into it, as you've described. This allows building a condenser mic
without any external source of bias voltage on the plates. Older
condenser mic designs used a power supply to provide a couple hundred
volts or so of bias between two metal electrodes. The electret eliminates
the need for this high-voltage bias.

But the signal coming from the membrane in a condenser mic (electret
or otherwise) is extremely high impedance - you can't draw any current
at all from it. So all condenser mics have a high-impedance to low-
impedance buffer amplifier built into them. These days, it's usually
a FET of some sort. This FET amplifier needs operating current, and
this is also called "bias". This bias current is supplied on the signal
wires by a resistor.

To drive these two-wire mics, you need a resistor connected to a
power source (typically several K ohms) to provide the amplifier bias
current, and a capacitor to pick off the audio signal while blocking
the DC voltage created by the bias current.

So, a classical condenser mic needs both a bias voltage for the microphone
capsule, plus a bias current (power supply) for the amplifier. The electret
mic gets rid of the need for the former, but not the latter.

These days, I think essentially all of the landscape lighting
"transformers" are really switching power supplies driving a much
cheaper high-frequency core, and generating lots of hash. They just
feed the secondary AC to the lights. But the control transformer idea
is a good one ('cept maybe for what the 'lectrical supply house will
charge for one).

I'd look for one at a surplus outfit like Surplus Center. I've gotten
things kind of like that from them.

Cheers,
Tom

Hello Everyone (anyone?),

I have a schematic for a 5w transmitter that I want to make changes on. It has a 5v & 12v power sources that I want to make more like 3v each. I can email you what I have. Please help before I pull all my hair out.

Thanks!!!

Jeff

I was a big fan of hr and was even published twice in it. Some months ago,
someone at CQ put out a request for a few back issues that they were missing. I
had them and offered them up, but they found them elsewhere.

I assumed at that time that they were going to do a CDROM. However, I was in
Newington in September and talked with one of the editors that was working on a

piece I did for the latest Antenna Compendium and he mentioned that they were doing the CD. That's all I know it, but I too look forward to having everything in one place. I can use the room!

From: Bob <balbert@cnmnetwork.com>
Message-ID: <Ono34.81319$5W2.2296762@news6.giganews.com>
Source record: 65081

An electret microphone is a 'condenser' microphone. They are basically a pair of electrodes, the capacitance between which changes with sound pressure.

In order to get an output, a microphone like this must have a bias potential applied, with a dropping resistor. The higher the potential, the better. To eliminate the need for an external power supply, this little capacitor microphone, made of plastic, is charged while heated. When cooled, it retians its charge because the material is too hard for the lttle dipoles to go back to their normal state. So we have a built in charge.

The word electret means a permanently charged material.

I suspect that they do help a bit, but that the benifits are probably
limited.
OTOH, there used to be a different type of "bulb saver" that was using a
thermistor in a rubber ring, that again, pressed into the socket.
The bulb would "come up" slowly.
This DID work(at least on the turn-on surge anyway).
And no extra flicker(the bulb DID end up a bit dimmer though).

Hi all!

Can anyone point me to a source for crystals. I'm converting a CB rig over to ham. I did the same conversion 10 years ago and got my crystals from JAN. They still grind 'em but they are pricey at $10 each. Just looking for a little better deal if anyone can help.

They are HC-18U type with solder-in leads.

Thanks!

Jack

4729. Broadband VHF frequency doubler

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-08 00:00:00 UTC
From: Raw Power Radio <rawpowerradioNOraSPAM@go.com.invalid>
Message-ID: <01906254.c564dbcb@usw-ex0102-013.remarq.com>
Source record: 65085

While experimenting in my lab, I built a very stable (1kHz of drift) VCO that spans 43MHz to 55Mhz. Redesigning it for 88-108 resulted in a range of only 90-107MHz and degraded stability. Naturally, it occurs to me that doubling the output of the stable 43-55MHz VCO could be a useful approach for a simple 3-meter exciter. Any recommendations for a good doubler circuit, preferably of the "no-tune" variety and without excessive insertion loss? I have seen some application circuits for doublers using the LM/MC1496 balanced modulator, but I am skeptical of the capability of this device at FM broadcast frequencies. (The operating range is vaguely stated as "up to" 100MHz in the datasheets). I am also aware of the practice of feeding one signal to both inputs of a four-quadrant multiplier, but these devices are costly and the ones with which I'm familiar are not usable at hundreds of MHz.

Get any general purpose mixer, such as the MiniCircuits ASK-1 or equivalent
and connect the LO and RF ports in series. Drive them with 5 mW at the
fundamental. Shunt the IF port with an RF choke and couple out the
second harmonic from there. Tip: use a low pass filter with series
inductors at the input/output between the source and the LO/RF input.
Not essential, but improves performance.

Andre,

If you do a web search on terms like "pirate radio", "LPFM" and "hobby broadcasting", you will find a number of sites that offer schematics for VFOs operating in the 88-108MHz broadcast band. Shifting the range of these oscillators up by 10MHz is usually a simple matter of adjusting coil turns spacing. The circuits you will find on these sites range from simple single-transistor "bugs" to fairly sophisticated push-pull self-doubling oscillators. Don't expect world-beating performance in terms of stability from any free-running oscillator in the 100MHz range, however. Professional broadcast equipment and even much of the "pirate" gear nowadays is PLL-synthesized.

For a simple and relatively inexpensive ($16) one-chip solution, I suggest the POS-150 VCO module from Mini-Circuits. This module spans 75-150MHz and operates off a 12V supply. You can run it from a maximum of +15V for higher output (10mW). By impressing audio on the tuning voltage, you can even use it as a nifty little FM exciter... a great little hobby project or mini radio station for the kids. Stability is pretty good as long as the tuning voltage has a low source impedance. (I'm not sure why this is, but it was mentioned to me by another hobbyist and verified by my own experiments).

I don't know about 10W devices, but there's the 2SC1971, which will do 6W output at 400mW input with a 12V supply, and is relatively inexpensive (about $7). It comes in a plastic T0-3P package with the "tab" connected to the emitter, so you can bolt it right to your heatsink without insulation. I used the NTE equivalent in a 6 watt amp for the FM broadcast band. (I think it's NTE342, but don't hold me to that).

Just make sure that you use a FULL BRIDGE RECTIFIER on the secondary! If you don't the high DC current, due to a half bridge rectifier, through the transformer secondary winding will saturate the core. You will also need a good heatsink for the diodes and a snubber network, series RC, across each diode to control spikes from diode recovery effects.

4737. CB radios transformation

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-09 00:00:00 UTC
From: py1ll@my-deja.com
Message-ID: <82o5d0tae1@nnrp1.deja.com>
Source record: 65004

Due the odd frequency distribution of the CB channels, normally the channel switch is very complex. So, when we try to transform/convert those radios to ham bands, the 10KHz (ideal) steps are not got (there are some 20KHz steps and channel 24 and 25 have lower frequencies than channel 23).
To overcome this problem I've used with success an EPROM or ROM (this is smaller) between the switch and the PLL divider, transforming that odd frequency distribution into a well behaved 10KHz steps band.
The ROM must have its address inputs connected to the switch and its data outputs connected to the divider inputs. The ROM must be programmed in such way that the bits are rearranged to get a normal frequency sequence.

You can use a FM detector IC for AM demodulation by splitting the signal into two paths; one path goes to the limiter input and the second path is connected to the "multiplier" input (Also called product detector) This is equivalent to synchronous detection which is very linear.You will have to experiment with the input level and phase to the multiplier input. Such a circuit was published in RF Design magazine a number of years ago. Regards! VE2AUC

I have an idea of constructing a single function IR control switch
that has variable frequency so that I can use it for many different
devices other than a TV or a VCR by using a programmable IR remote
control I could incorporate all these functions including the TV/VCR
into one controller.

Could someone help me out by way of a scan of a schematic of a single
function remote switch to see if I can use it to modify it's frequency
so i can make mutiple versions all operating on different frequencies
so I can control many different appliances ????

Any suggestions would be of great help

No need to worry... I'm not building a jamming device :)

Thanks to all for the excellent replies. I'm impressed by the level of
knowledge on this newsgroup, and I think I'll hang around for a while.

Incidentally, I posted the same message on another group and the
suggestions offered included a single transistor amplifier, biased into
the nonlinear region with the collector tuned to the second harmonic,
and a push-pull pair of class-B biased transistors driven 180 degrees
out of phase with the collectors tied together.

I was back in the lab last night, and I did manage to build a VCO that
will work well across 88-108...provided it was not loaded whatsoever.
As soon as I loaded it even very lightly with an amplifier or even a
buffer, the performance and tuning range degraded.

Considering how cheap they are, the curious might well buy an electret element, or take one out of a junk piece of equipment, and take it apart. I'd seen diagrams, but a few months ago I actually took one apart when a similar question appeared elsewhere. I had assumed that the FET would be some tiny non-standard package, but the one I opened was a regular plastic encased FET, which could be used elsewhere. Most of the electret package is indeed taken up with the FET and the resistor or two.

It looks synchronous, it "feels" like synchronous --but it's not.
It's called quasi-synchronous. Why? Because if you were to feed it a
true DSBSC AM signal, it wouldn't be able to capture the signal.

What you need is an IF splitter, one path to a product detector, one
path to a X2 multiplier and limiter. Then you divide the doubled and
limited carrier back down to your carrier frequency, make adjustments
to the phase, and THEN you will have a synchronous detector.

The reason for the frequency doubler is because with a true DSB
signal, merely limiting it will give you a messy, wide signal --not
the carrier. The only way you can get the carrier to emerge from the
limiter is there was already a strong carrier to begin with.

Doubling a DSB signal, will give you only a carrier with
(theoretically) no sidebands. Dividing the doubled carrier by two
will recover a DSB carrier on frequency. Naturally by the time you
propagate through all this, you'll need to tinker with the phase.

Yes; if you look in some older ARRL VHF manuals, at least, and probably
in newer ones too, you'll find just such a circuit. Drive the inputs
push-pull and connect the collectors together. Again, avoid driving
with a square wave, because then either one or the other transistor is
on all the time! (You can do pretty well if you just drive each with a
short pulse...class C works better, I believe, than class B.)

Cheers,
Tom

I have some detailed circuit for it somewhere, mentioned in Radcom
1975(?), can scan it if you need it
only problem I remember, is that it draws substantially amount of
current, 25-30mA whether you use 6 or 11V supply, SO41P was an
improvement in saving current, but this is also obsolete for some
years

Have used the IC for FM-quadrature demodulators on 455 kc and 10.7Mc,
as well as audio mixer/oscillator, AM/SSB-demodulator and
phasedetector

A couple of weeks ago I posted a message asking for two of the smaller knobs for the front of my Drake 2B. It has had some dreadful 'wronguns' on since I got it.

The first guy to reply ceased contact when he found I was in the U.K. The second guy to reply KNEW I was in the UK, said he'd sent them and now he won't even reply to my e-mails. I've offered him money too!

I am more than willing to PAY for a couple of knobs if someone will just help.

In an earlier posting another amateur offered to send me details for my RME69. I sent him $10 as agreed and I got a great set of copied info. and can now rebuild my radio.

ANYONE have a couple of knobs?

There have been a couple good IR control programs associated with the new BasicX microcontrollers from Netmedia. You have to go to the "onelist" bulletin board - www.onelist.com/community/basicx and search under IR controls.

Microchip (www.microchcip.com) also has a IR control program somewhere in their app notes.

Hello! I cannot understand how a frequency doubler can remove the sidebands of an AM modulated carrier! When the carrier is 100% modulated, the envelope is going through a
zero signal value and if fed to a frequency doubler should also give zero. I am very interested in this idea and would appreciate reading on the subject. I have seen the mention of quasi-synchronous before for a TV detector in which the carrier is regenerated by limiting which is easy because TV modulation modulates to 87.5% only leaving a risidual carrier of 12.5%. The results were not good because of the VSB nature of the TV signal. In television professional demodulators, a true synchronous detector is one with a regenerated carrier using a VCO and PLL in which there is no AM or PM sidebands. In the article of RF Design magazine, I think that the signal fed to the limiter was first filtered with a very narrow crystal filter. Regards!

Message-ID: <82ql3gsds1@pthp35.telecom.pt>
Source record: 65024

Hello dr OM's

I am looking for solutions on building an simple audio cw filter. As far as I have seen there are two simple solution (excluding DSP):

One or several cascades of band-pass filters (I am bilding one based on a tl084 4 ampop)

One simple bandpass filter, drivind a pll, driving a audio oscilator. When the pll locks into the receiving signal, it would activate the audio oscilator, giving a qrm free signal.

Anyone has tried one of these last "pll filters"?

Thank you

Luis, CU2IJ

4758. Antenna Feedpoint Z ?

Source record: 65025

NEW PROGRAM ZL_ZIN.exe

COMPUTE LOAD IMPEDANCE, RL + jXL,
FROM LINE INPUT IMPEDANCE, Rin + jXin,
FOR GIVEN Zo, LENGTH, LOSS & VF of LINE.

This program allows your new hand-held R + jX bridge to be used with a long test lead without great loss of measuring accuracy. An obvious application is determination of antenna drive-point impedance when measurements can be made only at the transmitter end of the feedline. Not only is the true SWR on the line itself computed - the reason for it being there becomes apparent. There are other professional applications.

It handles Zo from 20 to 800 ohms, at frequencies from 0.1 to 1000 MHz

Zin can be entered in two forms:- parallel or series R and X. On entering one form the other equivalent form is immediately displayed.

Zload is computed in 3 forms:- parallel, series and magnitude + angle.

Exact transmission line formulae are incorporated in the program. It is convenient, fast and accurate. No doubt with some regret, you will never return to the Smith chart.

ZL_ZIN complements programs such as RJELINE3 and COAXPAIR which compute (amongst a variety of other things) input impedance for a given terminating impedance.

Download program ZL_ZIN in a few seconds. One file only. Not zipped up. Run immediately.

I've always heard them called "CW Regenerators" and I tried a couple of simple ones (one based on a 567 and one on an EXAR chip, if I remember correctly) about 10 years ago. They worked well for strong, clear signals, but for weak, noisy signals the analogue filters (or ears) were better. I don't know how well more modern chips would work.

15 Turn Calibrated Dial - NEW

This precision dial has a 0-100 scale around its circumference, and a turns counter from 0 to 14. It will keep track of 15 turns from 000 to 1499. There is a lever on the side for locking the knob in position. It attaches to a 1/4 dia. shaft. Overall diameter is about 2 inches. I have several more of these if you need more than one piece.

Electric Elapsed Hour Odometer Counter

Ideal for keeping track of how long a piece of equipment is being used. Simply connect to 115VAC via screw terminals on rear, and counter will run, showing total elapsed running time. Resolution is 1/10 hr. Maximum is 99999.9 hours. Has been used for 13.7 hours. Mnufactured by Stewart Warner. Can be panel mounted. Guaranteed to work. Looks like new condition.

RACAL RF Amplifier

This is the RF amplifier from a RACAL 6217E receiver. It will amplify HF signals from 500 kHz to 30mHz. It is powered by -16 VDC, and has an RF in connection and an RF out connection. There is also a connection for AGC, if AGC control of the RF amplifier is desired. It was working fine when it was removed from the radio. I do not have a schematic, but I do have a description of the circuit from the "Theory of Operation" section of the manual and a block diagram of the receiver showing how this RF amplifier was wired into the circuit. The connections are also marked on the circuit board.

Source record: 65040

I would like to replace a resistor in a circuit with a variable resistor (or POT). I am confused. Why does a POT have three terminals for connecting wires??

One of them must be for the input to the POT, One of them must be for the output of the POT but what is the third terminal for??

4774. FS: MMICs and more for builders

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-10 00:00:00 UTC
From: Brad Thompson <Brad_Thompson@pop.valley.net>
Message-ID: <3851A9AE.1C5@pop.valley.net>
Source record: 65041

Hello-- Revised 12/10/99

I'm offering homebrew builders oddball, offbeat and hard-to-find NOS RF components, including...
***
Hewlett-Packard MSA-0786 MMICs ($1.00 each, $5.00 for 6, $10.00 for 15, or $25.00 for 50 pieces); DC-2 GHz. These are taped and reeled and have leads configured for surface-mounted applications. Specs are available at(or with order)...
http://www.hp.com/HP-COMP/index.html
***
1N5711 Schottky diodes, full-length leads, taped and reeled, $1.00 for 10
pieces
***
1N5821 Schottky rectifiers, full-length leads, bulk packed, $1.00 for 8 pieces
***
PIN diodes, no other specs available; full-length axial-leaded packages; individually serialized in sealed-foil envelopes. $1.00 each.
***
JAN 1N748A Zener diodes: individually sealed in mil-spec foil packets for your protection<g> in 1983.
$1.00 for 6 pieces.
***
SD-201 Signetics DC-2 GHz DMOS single-gate FETs four-lead TO-72 can (like TO-18 w/shield lead). A conductive-rubber antistatic "O" ring encircles
all four leads. Specs (available on request and with purchase) include S parameter plots. $1.00 each, $3.00 for 6, $5.00 for 12 pieces.
***
TN-2219A National Semiconductor NPN general-purpose NPN transistor:
100 < hFE < 300 at Ic= 150 mA; BVcbo = 75 V min.; BVceo = 40 V min.;
Icbo = 10 nA max. at Vcb= 60 V; Cob = 8 pf max.; Ft = 60 MHz min.
at Ic = 20 mA. NF 4 dB (max.)
In TO-237 metal-tabbed plastic package (similar to TO-92); this package reduces thermal resistance from 125 C per watt for a TO-92 to 50 C per watt for the TO-237.
Ideal for building a QRP rig around a single device!
$1.00 for 20 pieces; $5.00 for 120 pieces

***
Minicircuits T1-1T (1:1 turns ratio (center-tapped)) broadband RF transformers (80 KHz to 200 MHz); leads are formed for surface mounting but you can rebend for DIP insertion. Visit www.minicircuits.com for

full specs via their catalog.
$1.00 for 3
***
Minicircuits PSCQ-2-400 90-degree, 2-way power divider, 0.9 dB insertion loss, 225-400 MHz; $1.00 each
***
Fair-Rite cores (both type 43 mix):

2643023002 (a long-cored toroid) $1.00 for 10 pieces
2843002402 (binocular (balun) core) $1.00 for 20 pieces
***
Coilcraft p/n 142-07J08 single-winding adjustable inductors.
330 nH min./ 378 nH nom. /427 nH max.; 307 nH with tuning slug removed. Q is 112 min. at 40 MHz; 7.5 turn winding on 10 mm molded form.

$1.00 for 5 pieces; $5.00 for 35 pieces.
***
Pulse Engineering PE-53190 toroidal inductor for switched-mode power supplies.
Inductance = 12. 2 microhenries at zero DC; 8.7 microhenries at 2.5 A DC.

Price: $1.00 for 6
***
SAW-stabilized oscillators; intended for ECL circuits, but also reportedly usable as LOs. All are packaged in metal DIP cans.
$4.00 each, or three assorted for $10.00

Frequencies available are:
222.222 MHz (RF Monolithics HC1279; proprietary p/n marking)
350.000 MHZ (RF Monolithics HC1301)
366.667 MHz
400.000 MHz ($2.00 ea. but not NOS; removed from PC boards)
733.333 MHz
***
Teflon- and diallyl-pthalate insulated single-point turret lugs at $12.00 per 100 (many styles available-- e-mail a request for information and a jpg image showing various types).
***
Feedthrough capacitors: Spectrum Control 100 pf nominal (threaded bushing mount, hardware included). Attenuation is specified as -10 dB at 300 MHz, and -20 dB at 1 GHz.
$.50 each, $1.00 for 3 pieces. ***ONLY 36 PIECES REMAINING***
***
Air-variable capacitors manufactured by Cardwell (their part no. PL6348).
NOS surplus, m'fd. sometime in the 1950s.
--Configuration: consists of two plates separated by 0.1";
--Estimated capacitance range: 1-5 pf.
The adjustment shaft is 0.25" dia. by 0.5 inches long; bushing or

isolated mounting; easily disassembled for capacitance vs. frequency
modification, etc. A more-detailed description is available on request.

Price: $3.00 each, $10.00 for 5 pieces, $20.00 for 12 pieces.
***
Caddock MS281N NONINDUCTIVE resistors:

10 ohm +/- 5 per cent tolerance, 8 watt noninductive power film
resistors
Tinned axial leads (0.75 inches long) are formed for PC-board
insertion on 1.2-inch centers. These are NOS, bulk-packed parts.
Note: these measure well within tolerance at +/- 0.2 ohms typical. Full
specs are available in PDF format on Caddock's web site
(www.caddock.com)
but highlights are:
--Temperature coefficient of resistance: 50 ppm;
--Power rating: 8 watts at 25 C, derating to 4 watts at 150 C and
0 watts at 275 C;
--Noninductive design: serpentine film layout cancels magnetic field-
equivalent inductance of a straight piece of wire of the
resistor's body plus lead length.

Applications include:
--Current sampling;
--Cathode bias;
--Dummy loads for audio and RF applications.

Price: $1.00 each ($10.00 for 12 pieces); only 70 pieces available
****
Six-lug terminal strips, like Keystone p/n 825: six isolated, tinned
steel lugs mounted on a brown phenolic insulating strip, arranged in
groups of three on either side of a central mounting bracket. There's
no center grounding lug, but you can add a jumper to an adjacent lug
or two as required. Tie-point strips work well for breadboarding if
you use unetched-copper PC board laminate as a ground plane.

The lugs are spaced on 0.375-inch centers; mounting bracket has a
0.140-inch hole (use a 6-32 screw for chassis mounting).

I've sold thousands of these, but my supply is running low. Buy a batch
now before they all go to good homes<g>. ***DEFINITELY THE LAST CALL!
ONLY A FEW HUNDRED REMAIN***

Prices: $.15 each, or $6.00 per 50 pieces, $10.00 per 100 pieces.

****
* NOS Warranty policy *
****
Scanned images or digital photos of components are available on request.

If you purchase NOS tubes or components and find them unsatisfactory
upon your inspection, notify me within seven days and return items in
as-received condition for a full refund or replacement (if available).

This material is subject to prior sale and is supplied as-is, as
new-old-stock (NOS) merchandise, with all responsibility for safe and
successful application residing solely with the purchaser.

If you're searching for oddball components of any vintage, don't
hesitate to inquire about availability.

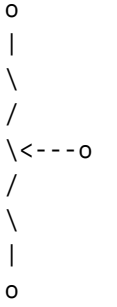
--> A potentiometer's terminals are connected like this:



The two outer terminals are connected to the ends of the resistance
element, the center one is the adjustable 'wiper'. The reason it's
designed this way is so it can be used as an adjustable voltage
divider. For use as a simple adjustable resistor, use the wiper
and one outer terminal, and leave the other unconnected.

Message-ID: <82t3lt$88h$1@news.netcologne.de>
Source record: 64946

Hi

I think of buying an external "PC-Radio" like WINRADIO and want to use it not only as a receiver but also as a simple spectrum analyzer. In principle it should be possible to correct the frequency response and the lineartity of the RSSI signal by software.

Does anybody here know whether the control codes sent to the receiver via RS232 and the structure of data telegrams sent to the PC are documented? And are there lots of birdies and other artefacts with the receiver mentioned?

Peter

4779. Wanted help with IR control circuit - detector.pdf (0/1)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-11 00:00:00 UTC
From: daren@powerup.com.au
Message-ID: <38523454.38282@nntp.powerup.com.au>
Source record: 64947

I have an idea of constructing a single function IR control switch
that has an alterable PCM possibly by some dip switch configuration so
that it can be used for many different devices other than for a
TV/ VCR
by making it a single function unit it could easilly be used in
modular form ie it could be housed in a box holding any number of
similar IR switches but all sharing the same power supply.
by using a programmable IR remote control it would relieve the need
to construct one and it could incorporate all the functions of the
various IR switches including the TV/VCR into one controller
.if the IR reciever switch could be designed to have a built in IR led
to emit the PCM needed to trigger the reciever , it would alleviate
the agro we all have of when you lose the remote,and the switch
becomes useless and would enable fast changing of the PCM to avoid
conflicts OR by arranging to have the same PCM for the same devices in
different rooms etc and it would cut down the number of buttons on the
remote needed to control everything and as programmable IR remotes are
programmed buy recieving IR pulse codes it would streamline the
setting up of the remote controller simply setting the PCM on the
reciever press a button to emit that PCM into the programmable
controller and it's all set

I have enclosed a schematic of a typical IR reciever but I'm affraid
it's a bit beyond me, and I was hoping that somebody might have a look
at the schematic for me and suggest how I might be able to alter it to
include the functions I mentioned.

Any suggestions would be of great help

Common practice is to connect the "unused" end terminal back to the
wiper terminal. This prevents the resistance from jumping to infinity
if the wiper arm momentarily looses contact.

4785. Blocking Cap for computer Mic Jack

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-11 00:00:00 UTC
From: Rob <NoEmail@NoWay.com>
Message-ID: <QIu44.197417$5r2.493524@tor-nn1.netcom.ca>
Source record: 64953

I understand that on most computers, the computer mic jack also has DC for powering some computer microphones.

I would like to connect my audio out from my radio to the computer's mic in jack for SSTV, RTTY etc. I would also like to use an audio isolation transformer to break up any ground loops. But the audio isolation transformer would ground DC on the mic jack (and may cause problems!)

I would like to be safe than sorry.

Considering the impediance of the audio isolation transformer (600-900 ohms) and considering that I would like to pass 400 Hz to 3000 Hz audio signals from my Rig to the mic input jack of the computer, WHAT Value should the blocking cap be??

1 Micro farad? 10 Micro Farads? 100 MicroFarads?? (I may have to use an electrolytic cap??)

Any ideas??

A 'net friend sent me a bag of these diodes, and I've designed a couple of neat little VCO circuits around them. But it seems that this is not a readily available part, and I would like to know its characteristics or a direct equivalent part number so that I can specify a more readily available part. I've looked everywhere I can think of, and I can't find ANY info on the BB409. Any info will be much appreciated.

Yes, there are ways to interface to PC's, all very expensive,
Computer Concepts, Inc. , Control Sciences, Inc. offer PC
boards and also convertors. Analog Devices makes a
interface chip also.

Rob wrote:
> I would like to replace a resistor in a circuit with a variable resistor (or
> POT). I am confused. Why does a POT have three terminals for connecting
> wires??

A pot is a fixed resistor with a movable tap. The position of the tap
depends on the setting of the knob. So if you have a 10,000 ohm pot,
the resistance between the two outside terminals is always 10,000 ohms.
But the resistance between the center terminal and either outside
terminal varies. If the resistance between the center and the "left"
end is 2,000 ohms, then the resistance between the center and the
"right" end must be 8,000 ohms; if the resistance to the left is 6,000
ohms then that to the right must be 4,000.

For what you're doing, use the center terminal and either end terminal.
Which one you use depends on which way you want the knob to work. (do
you want the resistance to increase, or decrease, when you turn the knob
clockwise) If you're only going to adjust it once, it really doesn't
matter.

The specs for the BB409 are as follows: Vt = 4 to 30V
Q @
4V = 270
Q @
30V = 600
Cmin
= 4pF
Cmax
= 33pF

Hello. I have a AM/FM analyzer model AF-250L made by Sigma
in the 70's and sold by
Amateur Wholesale Electronics. Do any of you out there have
a manual?

Thanks,
Randy KB8ASO Milan IN.

Anyone know of a source of these for less than $25 a pop? Anyone have a pair in their junkbox?

The bias supply in a friend's Scrapwood 930 decided to put a full 12V on the bases in the final board - and I even got yelled at by my wife for stinking up the house when they fried.

Appreciate any leads.

Unfortunately, my line input jack does not work.

So I will have to use the mic jack, isolation transformer and a blocking capacitor.

What value should I use for a DC blocking Capacitor?? Perhaps 1 or 10 microFarads?

There is a probably a conflict between ARD and other applications. Suggest do a complete "uninstall" operation (not just "delete") on various applications, one at a time, such as printers, word processors and anything else that you can "reinstall" later. After each uninstall, reboot the computer and try to run ARD. Uninstall and re-install ARD and try again. Finally, re-install Win95 files from the 95 CD. If ARD starts running, then reinstall the applications, one at a time, and test ARD after each step.

shared these priceless pearls of wisdom:

->Has anyone made any progress at a fix for the problem. It's a nice program if

->you can get it to run!

I couldn't get it to play for about three months. I shoved it over in a corner of my engineering programs window and let it sit for a while. I probably fiddled with this and that, probably had to reload windoze due to crashes, did some other hard disk manipulation like cleaning and stuff.

Fired it up one day while I was bored and bingo. It loaded and played just fine. I don't know what fixed it, probably never will. And like you, the "company" had absolutely no help for me.

Some day when I "fix" the original problem back, it will go tango uniform again, and when it does, I'll be back in the same "what the hell did I do now" mode. Until then, it seems to work just fine. But I'm not putting anything into it that I depend on for the business.

Having said that, of course, I went to "play" with it again. Guess what.
BURRRRP. Belly up again. I've seen advice that says "uninstall this and
unistall that and see what the conflict is". The conflict is that ARD is about
the most unstable Windoze program I've got. Look at it crosseyed and it goes
away.

Sigh.

Tantalum capacitors are a form of electrolytic cap.
They are best used in low impedance applications because
microshorts may show up in high impedance applications.

I've been using alkaline batteries for over 30 years, and I have _never_ seen an alkaline cell that "leaked" or had an odor. (I'm old enough to remember when the _only_ consumer batteries were zinc-carbon cells -- which are still made! -- and they _often_ leaked, severely corroding the equipment in which they were installed.)

The most-common problem with alkaline cells is the appearance of a white deposit on the negative terminal. This stuff often gets on the equipment contacts as well. If the contact contains copper, you might see a bluish-green deposit, too. These deposits can be cleaned with household ammonia, followed by a flush with isopropyl alcohol.

If your cells are leaking or giving off odors, you are most likely storing them incorrectly or "abusing" them in some way.

<edit>

I have never had any problems, in fact I have some Duracells
in one remote that are dated "Best if installed before Jul 94"
and are still working fine.
They are usually dated for about three
years shelf life, so these must be more than 8 years old.

Pulled some badly corroded cells from an 8 Track player the other day,
but they had been in there since the days of Disco!

Eric

I'm seriously considering buying one of the big (and cheap
nowdays) hard drives, partitioning it to several virtual
drives, installing Windows in each, along with a single
application, boot from DOS, select the appripriate drive and
go with that drive/version for whatever application I want
to run.

The solution stinks but not as much as the problem.

Dick

I would say that your best bet is to use Shielded Twisted Pair (STP) cable. It is the same as Cat5 cable but it's got a metal shield around the conductors. It's a little harder to work with than UTP but it operates at 10BaseT and 100BaseT.

Hi, all,

I had the meter ruined in a Eico 256 VTVM. I know, it seems strange but the alkaline fumes from a leaking Eveready alkaline cell worked their way into the movement and desolved the aluminum pointer needle.

If you have a vintage portable with a repro battery pack beware!

Chaz :-)

Your probably better off putting in MRF 422's in. Better check, I do not
think MRF 485 are good with a 28 volt collector supply, but I will check.
You must have removed the 31 volt zener diodes on the final board.
They are there specifically to short and open the fuse on the power supply
board BEFORE the final transistors fail. 73 Cliff K7RR

The cheapest solution is to use Paint, since it comes free with Windows.
And, it's possible to avoid drawing your own symbols. Just:

1. Browse the millions of web pages that have schematics

2. Find ones that have the symbols you need in a form you like.

3. Save the image onto your computer.

4. Convert the image to a .BMP file with your favorite freeware graphics convertor.

5. Cut the symbols you need from the file and put them into another file called symbols.bmp or similar.

Now when you want to draw a schematic, bring up 2 copies of Paint, one with the symbols and the other for your new file. Copy from symbols.bmp and paste into the schematic.

Another possibility is to scan in the page from the ARRL handbook that has all the schematic symbols and save that as your symbol file.

I actually used Paint quite happily for several years this way, until my schematics needed to be generating net lists for a layout program. Since it was one of my clients that needed that, I was able to get them to pay for a professional capture package. But if it hadn't been for that I'd still be using Paint.

Remove the case lead and let it float! You shorted the input to ground
when you did this. Rewire and try again! Cliff K7RR

Anyone care to recommend a simple single chip fm receiver - I am looking
for a pretty simple (even boombox) type to monitor only one frequenc
near the fm broadcast band.

Actually, it really doesn't take that long, especially compared to learning a full-featured capture program. One good schematic will contain most of the symbols anyone would ever need. I just mentioned the millions to give an idea of what's available out there. And the cut and paste time is quite comparable to the component select and insert time on a full-featured program. I can turn out a schematic with Paint as fast as I can with Orcad Capture. It just doesn't have all the netlist and layout info, the revision info, etc. It may not be optimal, but for those with limited resources, it sure beats pencil and paper.

Cliff - no such luck. Someone had replaced the driver xistors and the base lead on one was intermittent. Soldered it back in but now the xmit audio was distorted. I repaired all kinds of intermittents with this crappy radio (dirty relays, dirty pots) so I tried pushing a bit on the bias pot with a plastic stick while xmitting (THAT was dumb!) and rreading the bias voltage. Poof! Sure as hell, the pot was intermittent.

BTW found a NTE sub that is only $10.50 each from Allied.

The Vc max on the MRF485 sez 25V. Looks like pretty close tolerance to me, but then almost everything about this radio is bottom of the barrel.

Thanks and 73 - John

Hello--
You could detune a cheap FM receiver to the frequency of your
choice-- that's probably easiest.

A few years ago, Radio hack offered a TDA-7000 (if I recall correctly)
single-chip FM receiver for a few dollars. This might still be
available-- comments, anyone?

>I don't recall offhand who made the J309/U309 (and related J310/U310)
>parts ... it's been a while since I've seen them used.

They were made by Siliconix, and I've seen them at local surplus shops.

The other message is correct, the J versions are the plastic package and the U versions are the metal case.

For most purposes, they are the same except the fourth lead on the metal case versions is connected to the metal case itself, and is usually grounded.

If you are using it to replace a plastic pack device, cut off the fourth lead and just use the other three. You may want to use a VOM to measure and verify which is the case lead.....

Jim

It's not freeware, but I've found CircuitMaker from MicroCode
Engineering (www.microcode.com) to be well worth the investment (around
$250 or so for the standard version).

Not only can it draw darn good schematics, it allows you to build an
analog, digital, or mixed-mode circuit and simulate the crap out of it
using a well-done SPICE engine. No more burned components or messy test
benches.

I chose it over Electronics Workbench because of the lousy support I
got out of the people that make EWB.

Best of luck.

Hard way, use Windows Paint. There's some symbols on my
home page: http://www.qsl.net/ei9gq/bits.zip

Easier way, Use a standard drawing program like SmartDraw or
a free/demo version of a CAD program. Try Eagle CAD from
http://www.cadsoftusa.com

Hi, all

I just was given an old dish from a meteo radar. The az-el mount uses synchros as a position control. I want to track satellites from my PC. Is there a way to digitize the output from a selsyn, (or synchro, resolver) and to feed it to a computer?

Source record: 64973

Some time back there was a discussion about problems getting the ARD program to load properly. I also have the problem and no answers from the League except to tell me they know of the problem and no answers as to why it happens or how to fix it.

I have been able to get the program to run again by adding an additional IDE harddrive on the second IDE cable in my computer. If I remove the drive and restart the program, it hangs again at the opening window and I get the vertical bar in the lower left. This was all found by accident but for me, it works everytime. I run WIN95, S3 PCI Video card and a Cyrix 300MKII processor.

Has anyone made any progress at a fix for the problem. It's a nice program if you can get it to run!

True, Microsoft is very unresponsive. A decent operating system wouldn't
cause you this sort of grief.

Keep a log of any system changes. Then you have a prayer of backing out to
a working configuration (though it is a slim prayer considering how a Microsoft
OS tends to booger itself up in the oddest places).

You do NOT want to use an electrolytic cap in this application. I'd use a TANTALUM (maybe 1uF) with the + side connected towards the computer (assuming the computer is providing a positive voltage). A good 0.1uF mylar would fine also.

4838. Re: ARRL RADIO RESIGNER (ARD) problem

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-12 00:00:00 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <3853895D.1EA21D5E@eznec.com>
Source record: 64977

Whenever you install a new application on your Windows system, it overwrites a number of system files. A well-behaved installation program should only overwrite files with ones having a higher revision number, and most probably do. The rationale is that the application might depend on bug fixes in the newer files in order to operate properly, so each application modifies your system to suit itself. The files which are changed are also used by other applications, so any previously installed software may operate differently as a result. Because your Windows operating system gets modified each time you install new software, and I'm sure your experience is common.

I had a similar problem with some rather expensive software I purchased, where it wouldn't do certain things. Technical support worked and worked at it, but were unable to solve the problem. I felt I could work around it (and there weren't many alternatives), so didn't send it back, but put it aside for a while while I did other things. When I dusted it back off some time later, the problems were gone.

A while back, I pulled most of my remaining hair out searching for a bug in a Windows application I was developing. The symptom was that sometimes when I opened the dialog box used for choosing files, printers, etc., the program would crash. The dialog box returned an error message with no message, and an error number not documented anywhere. After a lot of troubleshooting, I discovered that it would happen only after I opened Notepad or a couple of other Windows applications. I finally tracked it down to one of the Windows files which had been replaced by some application. The newer version, which the unknown application had installed, had a bug in it. I replaced it with the old file and cured the problem. Some time later, the problem re-appeared. Sure enough, something had re-installed the newer file again, so I replaced it again. This was happening with Windows 95. Later on, I installed Windows 98, and with it a file with an even later version number, and no bug. So now it won't be replaced (at least by the known buggy version), and the problem is hopefully gone for good. This file with the later version number will of course be copied onto the user's system (replacing any older version) when he installs my program. Who knows what bugs it might have which don't bother my program but will cause others to malfunction?

It's miraculous that Windows works at all.

I was just reading some information about the forthcoming Windows 2000 operating system, and it looks like Microsoft is going to try to control this in the future, by maintaining the updated files separate from the operating system. But time will tell. . .

Since tantalum capacitors are electrolytic, I assume you mean that an aluminum electrolytic shouldn't be used. Why not? I've used them in similar applications for decades, both for amateur applications and in the design of commercial products.

The required value is determined by the impedance looking into the mic jack. I've never looked closely at the impedance of sound card mic inputs, but would be surprised if it's less than 1k ohm. If it's as low as 1k, things will sound pretty tinny with 0.1uF, because it'll roll everything off below about 1.5kHz. (It'll be 3 dB down at 1.5kHz, and drop more below that.) At 1k ohm, 1uF will extend the frequency response down to 159Hz. (If the input impedance is 10k ohms, you'll get 159Hz response from 0.1uF. Do a little experimenting.) If there's no DC voltage on either your rig or the computer, use a couple of electrolytics in series, each having twice the required total value, connected + to + or - to -.

One thing that's worked for me is to simply reinstall the offending application. If any files got overwritten by something else, this should put back the newer version.

When things get REALLY bad, I've been known to simply restore the contents of C:\WINDOWS\SYSTEM from a backup made while things were working, and tell the backup to overwrite *everything* (even newer files) in that directory. I wouldn't do that unless you also have a *current* backup (and lots of time) as there's a fair chance of completely hosing the system. Also, even if it does fix the application you're working on, you'll probably break one or more other applications. At least you'll be able to figure out which one is conflicting.

Even in Linux, shared library conflicts seem to be a problem. Sometimes (especially with cheap disk space these days) I wonder if shared libraries are worth the trouble?!

The "uninstall the universe" approach is fairly dangerous, as well as inelegant. If your software does not do a clean uninstall or the install media is corrupted, you could permanently lose at least the uninstalled program, at worst your whole machine.

If I was seeing this problem, first I would demand real support from ARRL. At the very least they should be able to give an installation manifest showing all the files they install, including dates and versions. If they won't even do this much, get a refund. If no refund, then boycotts and legal action are in order. If they are a class outfit that stands behind their product, then they should work with you to help resolve the problem. Since this is such a common problem, the best solution would be to make public the sources for the code that gets executed up to the point of the hang. About 15 minutes later someone out there will report back with the problem and a fix.

If I didn't want to deal with the ARRL, I'd load up a debugger like NuMega's Soft-ICE for Windows 95 and run ARD. When it hung, I'd break in and be able to see what the problem was. Or I could run ARD in Soft-ICE and trace through to the hang. This would allow me to isolate exactly which call was causing the problem. And if it did turn out to be a duelling libraries problem, I'd be able to identify the guilty libraries. Then a fix could be designed. One possibility would be to copy ARD's desired library to the ARD directory, change its name and patch the ARD executable to call the renamed library. End of conflict. And depending on just how good the ARRL was about their tech support, it might even be appropriate to post the corrected executable and library to the web.

I've done in excess of $300,000 worth of business on Windows platforms from 3.0 through the latest NT and only lost data when I had physical hardware problems (disk crash, etc.). My experience with misbehaving programs on Windows is that either they're ancient DOS-based programs trying to run in a DOS-box (and doing all the things that were legal back when they were young but aren't anymore), or they were poorly coded and insufficently tested. I haven't seen that much trouble with the libraries conflicting, though it's definitely a possibility, especially with the function/no-function flip-flopping. I've run many troublesome programs under a debugger and seen the generated assembly code, and they were uniform in being highly success-oriented and ignoring any error conditions. If it's a DOS program, you could either run it in real DOS (albeit giving up any cut & paste and swapping between apps), or upgrade to the Windows version if it exists. Otherwise, demand the tech support you deserve as a paying customer.

As for the OS religious wars, I started in computers back when the state of the art was punchcards and paper tape and did 14 years of assembly language

only programming, as well as 14 years on a command line only system. The last 7 years it's been on Windows and other GUI-based systems, as well as Linux. What I see from my viewpoint is that the people (on both sides) who are fanatic enough about "their" operating system to go around calling the opposition Windoze and Eunuchs need to get a life. Come on guys, it's just an operating system. Just use whichever one is the best tool for your current job. Don't get caught up in apples and oranges comparisons and gigabuck envy- life's too short and the world beyond the screen is too beautiful for you to waste your time. Try this - the next time you want to make fun of someone else's OS choice, call your significant other and make a date to see a movie, have a picnic or spend time with the kids instead. People will like you more and your blood pressure will be lower.

I had the same problem. I found that ARD works, when I use the original version of win95 "A" that was released in July 1995. There
were some unlabeled "slip stream" updates shortly afterwards that do not work. ARD does not work on Win95B, or Win98 first edition.
But it does work on Win98 second edition.

While trying to troubleshoot ARD, I swapped *all* the DLLS that were not tied to the window version. That is, everything except
USER.DLL, GDI.DLL, and KERNEL. It may be possible to swap these, but I suspect if I tried it I would spend a few days in "registry
hell".

Anyway, my particular ARD problem is tied to one of these three DLLs. All the other DLLs that ARD links to are the same.

Yes, sometimes it does not without a DC blocking cap since many computers
use current limiting to protect it from shorts. But some computers may not.

I rather be safe than sorry and use a cap!

Hi,
I have a Mirage 6m preamp, which stopped working during
testing of a homebrew 6m amp. The preamp was between
the rig and amp, so I didn't kill it from full amp power. With
the preamp on, it receives worse than when it's off.

When I called Mirage they said I probably killed the GaAsfet
called a U309, which they said is kinda sensitive. They said
they were out of it, but it was a
common part. At Mouser, I got an SK replacement, that
had 4 legs instead of 3. I matched up the legs (from the ARRL
handbook) and tied two legs together that included the case.
Needless to say, it didn't work.

Did I do something wrong, or is there a different replacement
FET I can use in place of the U309?

Thanks,
Bennett ko2ok in NJ.

Hi Roy,

Many thanks for the info.

Well, I tried to determine the input impedance of the mic jack by looking in my computer's manual. No luck. But the microphone I bought says it has an output impedance of 2000 ohms. I suspect my mic jack of the computer's sound card has a similar impedance.

A 1 microfarad cap may work. What about trying a 10 microfarad or 100 microfarad cap?

(I have seen 100 MF electrolytic dc blocking caps used when feeding an external audio amp -- see G4YNM's audio break out box in 1998 ARRL handbook (pg 22.32))

But so far most Hams are recommending 1 MF not the much large value of 100 MF

Sorry for the typo. My message should have read:

Yes, sometimes it does work without a DC blocking cap since many computers
use current limiting to protect it from shorts. But some computers may not.

I rather be safe than sorry and use a cap!

73's

Rob

Hello all. I have I feel more than my share of leaking
alkaline batteries.
I have had the things leak in the packages and in my
equipment.
All have been stored at room temps and were unused. I could
see
dead ones leaking but stinking new ones? The worst offender
seems
to be Duracell followed by Eveready. I buy other brands (
Panasonic,
Ray-o-vac and some other off brands) and they seem to leak
MUCH less
frequently. I have a transistor tester that I use semi
frequently. The
batteries are less than a year old (Duracell), still good
and guess what?! Battery
nasty goo leaking out. How are you supposed to keep an
emergency
flashlight around? I remember how bad the old carbon-zinc
batteries
were about this , but here lately the alkalines seem to be
getting the same
reputation with me. I have seen the old " We will repair or
replace, at out
option any device damaged by this battery if sent with
batteries prepaid
to us. " Have any of you out there done this and what were
the results?

73

Randy KB8ASO Milan, In.

p.s. I am sending this to the rec.antiques.radio+phono also
as I am sure
they have seen their fair share of battery damage!

I have had the problem you speak of happen so rarely that it is
something not even to consider. Admittedly, when it does it seems like
a major problem or world crisis. Aboard ship we use untold hundereds of
alkaline cells in everything from emergency beacon lights on our

survival suits, flashlight, emergency use only flashlights that are mounted on the bulkhead next to doorways, radios, VOM's and the list goes on... over the years maybe only one or two in the bunch leaks or develops a crystalline mass on the bottom of the cell. My suggestion, use cheap flashlights that you can justify for throwing away (or be assured of getting replace by the battery manufacturer) like those 2D size yellow Ray-O-Vac jobs.

I 've been told in three separate instances where a consumer has had their flashlight replaced because of leaking cells.

Duracell sent me certificates with no hesitation on their part to replace a package (and get an extra one free) of cells that had a leaker.

My best experience has been with Ray-O-Vac cells. I don't bother with Duracell and Eveready since they put those battery testers on the side which makes them stick in certain flashlights. I do use Eveready for other applications however. Duracell can bite the big one since they are more expensive than the other brands where I shop.

Randy:
I only had this problem once with Eveready batts and they leaked in a MagLite flashlight. Sent the flashlight to Eveready and they sent me a check to buy a new one. If I remember right the check was for a little more than a new MagLite cost me. This was maybe ten years ago or so. Don't know how they respond to this problem now.

4852. FS: pair of Morganite non inductive resistors

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-12 00:00:00 UTC
From: paul <apollo_six@btinternet.com>
Message-ID: <7tVuPOAFe9U4EwtE@btinternet.com>
Source record: 64991

Pair of Morganite tubular non inductive carbon resistors.
Marked as 150 ohms +/- 20% measuring 110 ohms and 120 ohms, in parallel
around 58 ohms.

6 inch long X 1 inch dia each with clamps

Placed in a suitable container and immersed in transformer oil would
make a fantastic dummy load.

15 GBP (23 dollars) the pair plus carriage.

The U309 sounds like the plastic packaged version of the J309,
which was a JFET, not a GaAsFET, as I recall. I recall it as being
a 3-terminal device, not having 4 leads, though, perhaps a metal-cased
version would have a lead to ground the case ...

I don't recall offhand who made the J309/U309 (and related J310/U310)
parts ... it's been a while since I've seen them used.

You might try one of the "advanced search" options, like at AltaVista
and search on " (J309 OR U309) AND JFET " or something like
that ...

Perhaps someone else recalls who makes/made these parts ...

73,

A very clean Kenwood TS-820S with copy of owner's manual for sale, $325 plus shipping from the Los Angeles area.

This was top of the line rig, one of Kenwood's most popular riges ever. Covers 160-80-40-20-15-10 meters plus WWV receive. Passband tuning, speech processor, crystal calibrator, digital readout, and more features. Over 100 Watts output on all bands.

I can get a copy of the service manual for a few bucks more. Probably won't need it; it's a solid, stable, reliable rig. SSB, CW, FSK.

4856. Re: Broadband VHF frequency doubler

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-13 00:00:00 UTC
From: Roger lascelles <rogerl@datafast.net.au>
Message-ID: <38545723.4B8EC734@datafast.net.au>
Source record: 64795

Hi !

Your frequency doubled signal will have twice the drift and twice the FM noise of the lower frequency oscillator. Are you sure your 100 MHz oscillator is worse than twice as bad as the 50 MHz oscillator ?

A two to one tuning ratio is quite ordinary for an oscillator. 1.5 to one is easy.

You don't mention actual frequency drift values, but it is quite easy to produce respectable oscillators at 100MHz. Many FM receivers have free running local oscillators. Hewlett Packard and many others used to sell signal genarators containing free running LC oscillators - we have one here for 10 to 512 MHz .

Almost anything will oscillate, but stable oscillators have controlled bias current. If the transistor is saturating at any point of the waveform, it will damp the tuned circuit and degrade noise and stability. If you are using a bipolar or FET, throttle back the bias current until the oscillator stops, then increase the current somewhat.

Frequency multiplication can be necessary, but rarely at 100MHz.

Regards,
Roger

I was wondering if anything was garbled along the way, since Siliconix
did make a U309. It is a metal case, though my Siliconix databook
from about twenty years ago shows it only has three leads.

case connects to Gate
|

G S (tab is here)

D

This is the bottom view.

The J309 is the plastic version

(flat side)
D S G

(again, the bottom view)

The 310s are on the same pages as the 309s. A quick glance makes the 309 appear somewhat better than the 310.

I'ms till wondering if we've missed something, that the FET is realy a GaAsfet. It would have been helpful to know what the SK replacement number was that the original poster used.

4860. List Of Stamp Applications [991213]

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-13 00:00:00 UTC
From: cjX@hth.com
Message-ID: <385490e4.24724153@news.sverige.net>
Source record: 64926
Cross-posted to: comp.robotics.misc,comp.home.automation,sci.electronics.misc,rec.radio.amateur.homebrew

Hi,

Below is the latest index of L.O.S.A and you can download the
complete L.O.S.A from the following places...

WWW:

http://www.hth.com/losa/

FTP:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

1.0 What is L.O.S.A all about?

This list was started back in -95 when I heard about (more or less)
uniqe problems that was solved by using a BASIC Stamp. Especially Guy
Gustavson's story (see #001) about how he saved his beloved cat Kesha
gave me the inspiration to start writing L.O.S.A. I hope Kesha still
is alive and having a great life. Now 4 years later there are 150+
applications described and I hope you will enjoy reading all (or
parts) of them.

The main purpose of this list is to get an idea of what other people
are using their BASIC Stamps for and maybe get some inspiration or
hints for your own projects. Some of the projects described in the
list also have links to source code and schematics for download.

1.1 How can I contribute to this list ?

If you have done something (big or small) with the BASIC Stamp that
you are willing to tell others please use the form given below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Visit the following Web site and fill in the contribution form...

http://www.hth.com/losa/

1.2 Why are some links dud's ?

Since people changes their e-mail and web addresses some links may be
dud's. If you previously contributed with one (or more) of the
applications please take a quick look and check your e-mail address

and/or web-links. I'm only able to keep the list updated if I'm
informed about changes, thanks in advance.

1.3 List of contributions

Somewhere along the way I was warned not to leave alkaline batteries in
a MagLite for long periods. I was told to remove them for a few seconds
every few weeks; something about slight outgassing plus aluminum sleeve
is all I remember.

You might be able to copy the installation software from the floppy across that network to the laptop, and then install it from there. I've been able to accomplish that with some software, unless it requires to be installed from a floppy.

A U309 is not a GaAsFET, but a standard Silicon N-channel Junction Fet in a metal can. It is available from many distributors as is its plastic case version the J309 and they are quite inexpensive.

I'm very "attentive" to the battery-operated devices I own, so I've never had any problems. However, I appreciate the advice about Maglites.

4865. UC734B and 3N128 Cascode

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-13 00:00:00 UTC
From: afrb2@cus.cam.ac.uk
Message-ID: <833506$7f1$1@pegasus.csx.cam.ac.uk>
Source record: 64931

I've been experimenting with a cascode RF amplifier using a UC734B as the imput stage and a 3N128 as the active load, with AGC RF voltage applied to the grid of the 3N128 (it occurs as the RF amplifier in an Eddystone EC958 Receiver).

I've got very little data on either the 3N128 or the UC734B (only the Towers data) and both parts seem totally unobtainable here (in the UK) from the usual parts suppliers. I'm beginning to suspect from the poor performance which I'm measuring (ac voltage gain of less that 0.1) that on or other of the FETs has died. I've replaced the 3N128 by a 3N201 with g2 connected to the source, which has partially improved maters, but the first FET has a drain source voltage of about a volt, which suggests that it isn't operating in the saturated region.

Does anyone have any idea at all of where I could find any more information (or replacements) for these FETs. Equally a pointer to a source of information on cascode amplifier design would be useful; I have the Siliconix book (desiging with FETs which touches upon the matter but doesn't have much detail).

> available-- comments, anyone?

I have used the Philips SA605/SA615 (used to be the NE605) which is based on the famous NE602. The 605 http://www-us.semiconductors.philips.com/pip/SA605D) has a mixer, IF amp and quadrature detector and RSSI. Philips also has some newer versions of the chip on their webpage http://www-us.semiconductors.philips.com/similar/SA626D) and you can buy them through Digi-key.

Date: 1999-12-13 00:00:00 UTC
From: af389@lafn.ORG
Message-ID: <385531BA.E880BDF3@lafn.org>
Source record: 64933

Hi,

This IC, MT02B, might be an RF PRescaler up to at least 2 GHz?

I found it in a DIGTIAL TV Tuner, working with the MC44817 Controller.
Tuner receives commands from 3 wire serial bus, but not the complex I2C.

Really need datasheet description. Searched Suppliers with PartMiner
but found nothing and Interent searches yielded nothing also.

Also, URL's to examples of using PC Parallel port for sending commamnds
to serial IC's would be helpful.
Looks like a nice usable Prescaler for QRP Counters or ? when I can
figure how to program it.

Thank you for any hints, 73, W6MIK

U309 sounds like a Siliconix JFET number, not a GaAsFET.
Is this a Mirage designation or what the part is marked
as? Is this a 3 lead or 4 lead device, otherwords how
many gates?

4869. New TRF kits avail in Jan2000

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-13 00:00:00 UTC
From: weathrship@aol.com
Message-ID: <19991213135014.20106.00000606@ng-fo1.aol.com>
Source record: 64935

Hello, I've got some pictures of an intended TRF kit planned for introduction in Jan2000. I'll be supplying the tube lineup (6K7G, 6K7G, 6C or 6J5GT, 6K6GT)

the tuning cap, audio xformer, resistors, sockets, capacitors, breadboard and front
see-through acrylic panel, pre-drilled etc.
see: www.ghostmoon.bigstep.com

I don't think I'll be supplying the power supply, the parts are too heavy and expensive. Should be a good starter kit for someone that wants to learn about and how to repair TRF's. They are pretty simple and I'm going to supply a construction manual with TRF theory, tube basics etc... should be a fun and good-looking project! This might be a good project for those starting out in basic electronics related to restoring your old antiques.

Thanks, tony

I've had batteries leak from time to time, but it's always been after they had been left in the device for a considerable time after they'd discharged. When possible, I try not to leave batteries in something I won't be using for a long time (although it takes years for a fresh alkaline to self-discharge). When leakage does happen, I've found WD-40 to do a good job of stopping the corrosion.

One solution to alkaline battery problems is to replace them regularly. Normally that would cost a lot of money ... but what if you could get them free?

If you go to your local market or photo shop where they develop the use-once-then-throw-away cameras in-house you will discover that most of them toss the empty cameras in the trash.

If you ask nicely they will give them to you. Inside you will find two barely used alkaline AA cells. Dig a little deeper and you will also find a nice electrolytic cap!

Be careful as the cap will still hold a charge that can "bite" you real good! Also be careful because that charge will always fire the flash at the moment you have your eye about 2 inches from it!

Just F.Y.I., proceed at your own risk, YMMV, etc. 73, DavidC K1YP

These sound like the energy storage ones from Fair Radio ($20) that I was
told would not work in an amplifier PSU. I have tested them at 2A ripple
current for an hour and they worked fine at 3500V 1A. I would be interested
in hearing other opinions.

Hi Roy,

Thanks for the message.

I understand that a larger capacitor (e.g 100 Mf) will more easily allow the low audio frequecies to pass through the capacitor but will it attenuate the higher frequencies more?? (e.g. 3000hz)

Rob

Try the book "The Art Of Electronics" by Horowitz and Hill.
There's alot of practical design insignts. Also check out EDN web site
at www.ednmag.com, there interesting design articles.

Thanks for the information. I did extract the S-parameters
using an example model given in the 2-port modeling chapter of the
book "A Guide to Circuit Simulation & Analysis Using PSpice". Can I
also generate the noise figure parameters (Fmin, Gamma_opt,Rn) using
Spice? The noise analysis covered in Spice books desn't seem to
provide useful information on how to do this. Do you know where I may
find more information on generating the noise figure parameters from
the Gummel-Poon model for the ARD?

4893. 4CX tube series gas question

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-14 00:00:00 UTC
From: hexter@blazenet.net
Message-ID: <slv54.1225$ce3.25834@typ11.nn.bcandid.com>
Source record: 64811

I have several 4X150A's , and 8930's that have a violet (not blue) glow. Since these tubes have such a small internal volume, it would seem that they would gas more quickly from even a very small amount of seal leakage over the years.

What is your favorite trick for de-gassing them, plate voltage on, screen voltage off? I am assuming there is no internal 'getter'.

>
>tnx de Angel Vilaseca HB9SLV
>Geneva, Switzerland

To control a 5 wire 'selsyn' from a computer is a large task,
and very expensive. I would suggest removing the 'selsyn' and
replacing it with a 'stepper' motor. steppers are very common,
and controls for them are reasonably priced. steppers can commomly
be found with 7.5 or 15 degrees of rotation per step. there are
micro step controllers that provide up to about 10,000 steps per
revolution

73 and good luck

4898. Questions about TEK 465 scopes

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-14 00:00:00 UTC
From: Joe McElvenney <joemac@xic.demon.co.uk>
Message-ID: <VA.00000062.01c0f6d1@joe-mcelvenney>
Source record: 64816

Hello,

I have purposely posted this to 'Homebrew' instead of 'Boat-anchors' because I believe it is a better group for the purpose as to my mind scopes and home-brewers go together.

Yesterday I picked up a clean, cheap-ish TEK 465 scope with relatively recent calibration seals - you know the type, "Remove these labels and we will kill your entire family and burn down the house". I was attracted to it over the 465B's they had in stock because, apart from some storage marks on the case, it was in pristine condition.

Now I'm pretty familiar with the 465B but would like to know the differences in its spec over the vanilla 465. Of course the 'B' is newer but this 465 seems to be functionally the same. It was made in the Channel Islands and has a 'British Aerospace' plaque on it if that means anything. It also has OPT's 4 & 7 fitted. I know that the '7' is the 12/24V option but am curious about the '4'.

The surplus house had a number of 465M's which were a different shape (tent-like) and which they said were the mil-spec variant but, as they were apparently not as rugged as the 465B, I doubt that was true.

I would also like to read-up in general on the Tektronix line of scopes and the company history and am wondering if there is a book available anywhere on this? If anyone has any answers to the above, I would appreciate hearing from them.

Opps, Sorry. I told you how to control it. upon re-reading
it seems you wanted to know how to interpert it's existing
position. Yes, there are I.C.'s designed specifically to convert
the phase relations of a 'syncro' or 'selsyn' to a digital
representation. Some convert directly to degrees in BCD, and some
simply convert to straight binary count as in 0 to 1023 etc.

The other reply giving the I.C. numbers is exactly correct.

The sidebands are removed by the limiter. Doubling the signal
recovers the carrier.

Basically, when you suppress (or null) the carrier, you're left with a
signal which shifts phase 180 degrees every time the modulation
crosses zero. Doubling this signal and limiting the result will
recover the carrier because 180 degrees * 2 is 360 degrees. The
doubled sidebands will be messed up, but that's ok. All you want is
the carrier. So you limit this signal and recover nothing but
carrier. Now, divide this doubled carrier by two, adjust the phase
for the extra delays introduced by the doubling, filtering, limiting,
and division circuitry, and you're on your way...

Except for the few cases where the modulation index drops to zero on a
real DSBSC signal, you won't have to work too hard to recover the
carrier.

Merely limiting a DSB signal with no carrier will not recover the
carrier. Instead, the limiter output will be "captured" by the
sidebands, resulting in an incoherent and distorted mess.

Some have used narrow band filters in an attempt to "lock on" to
whatever residual AM carrier may be left. This works, but it's not
easy to lock on and stay with a signal when your capture bandwidth is
so narrow.

The book by Stan Griffiths that Steve mentions is nice to have, but it doesn't cover any 4xx-series scopes except the older 453/454. There isn't currently a good buyer/collector/repairer/restorer's reference for the later Tek scopes and analyzers, which is a shame. As things stand, the only real resources are the Tucker Electronics catalog (http://www.tucker.com) and various Tek catalogs from the vintage you're interested in (70s through 80s in your case). These are readily collected on eBay -- there are always plenty of Tek and HP catalogs in the Test Equipment category.

There is also a book called "Winning With People: The First 40 Years of Tektronix" that was issued to all Tek employees some time back in the early 80s. This is an interesting and informative read, but isn't written from a technical point of view. Again, eBay is likely to be your best bet for digging up one of these. They are less common than the catalogs, and usually not as cheap. I think I paid something like $60 for the copy I bought. For a more technical perspective on classical Tek circuit designs you want to search eBay for the "Circuit Concepts" series of books they put out. Also the Jim Williams books on analog design have a few chapters written by some of the bearded gurus at Tek.

Mark Kahrs has some good info on the Tek 7000 series at http://www.caip.rutgers.edu/~kahrs/testeq/7000.html, but (again) this won't do you much good with a 465.

Along the same lines as the Stan Griffiths book on the older instruments, you want to check out the Tektronix virtual museum at http://margo.student.utwente.nl/~wel/tek.htm.

If I had an infinite amount of time and nothing else to do with it, I'd write the definitive buyer's/collector's guide to all of the great Reagan-era Tek and HP test equipment that's saturating the marketplace nowadays. I'd think that someone could make a few bucks by researching and writing such a book!

I think the key is to get many different books on electronics. Don't
rely on any one particular book. This is complicated stuff and no one
author is going to be able to describe everything in a way that is
going to help you. I often find myself scratching my head after
reading one author's description; I then go to the other books in
search of understanding. Good luck. Hang in there. Bill N2CQR

Well said. I've programmed since 1972, for W95 since 1996, and am currently using Linux. Neither is perfect. An OS is not written to be continually "set up". It's written to run and service >applications< and shouldn't be seen nor heard from otherwise.

Incidentally, in 3 years of intensive C++/W95 programming, I've seen just about every error possible, and NONE of them was caused by W95. Almost all errors are caused by apps, and what you see is not W95 "instability" but W95 trapping application errors as it's spozed to do, to protect the rest of the system.

Well, I don't think you will be building much of an oscillator
with it as it appears to be a twin diode. as for pin out, here it
is
1= plate 1
2= cath 1
3= fil
4= no connection
5= fil
6= plate 2
7= cath 2

filament voltage 6.3 at .15 amp

> amp!)

Some tube amps, yes, depending on the tube. If the interelectrode capacitances are low enough, it's simply a matter of shortening the plate coil by approx. 50% and retuning (assuming a pi network) as a starting point.

Note that not all sweep tubes will go to 6 meters.

If it's a bipolar transistor amp, it probably cannot be retuned that high. If it's got broadband transformers on the input and output, you might experiment with a couple watts in, and see whether it will swing to 6 m -- reducing the core size on the transformers _MIGHT_ get you there, though most of the older bipolar transistors run out of gain rather sharply above 30 MHz.

If it's a FET transistor amp with broadband transformers, it might already work on 6.

Happy experimenting, and thank you for rescuing an amp from illegal class D service.

> TNX and 73

Gudmundur,

There is no way to restore them, other than connecting up to a vacuum pump, and pumping them down as originally done in the factory. The gases must be removed entirely from the tube. Most transmitting tubes are this way; the vacuum is much harder (lower pressure) than receiving tubes.
They make a good paperweight...

For Sale,, PPS-15 portable radar system,
comes with everything required..
transit case,
soft backpack
tripod
r/t unit with readout and rangegate
headphones
battery and vehicle power cords
operations manual(copy)

these are current serviceable units Tested and calibrated 1992
they will detect and range objects to 3000 meters,
they have ALARM feature for specified scan area..

don,t miss this opportunity to own a very unique piece
of kit..

Years ago as an electronic tech for the FAA, I seem to recall the 4X250s would occasionally show a violet colour under normal operation. The original poster didn't state that he also noted a performance decrease. If the tube operates as normal, I wouldn't be too concerned about it.

FWIW, I'm told these units were aimed largely at the biomedical field.
You tend to see a lot of high-sensitivity, low-bandwidth plugins in that
series, compared to the 7000 line.

I have recently had a leak of 4 D-cell energizer batteries into my Mag light. I called them and they told me to send them the flashlight and batteries. I will do so as soon as possible. I have never had alkilines leak into anything that I have owned until now. I remember the carbon-zinc batteries leaking all the time. I had a hell of a time getting those batteries out of the light.

>I don't want to have to draw symbols for transformers etc by hand!

Sure, take a look at DesignWorks Lite

http://www.dsgnwrks.com/

There's a 30 day trial version but it was so good that I paid my $45 next
day!

Takes about 7 minutes to download.

Contains most of the symbols you'll need.

Available for Macintosh and Windows :o)

Once you've paid the small fee, they'll give you access to more symbol
libraries, too.

I have no connection with the company, other than as a satisfied user.
This software is *much* better than struggling with paint or draw programs.
Time is money in my business and this little program saved me a bundle.
There's a Professional version, too, that supports SPICE etc.

4921. homebrew FM demod...

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-16 00:00:00 UTC
From: AJ <alaje@sympatico.ca>
Message-ID: <3858500B.EC8FB346@sympatico.ca>
Source record: 64839

Hi,

I am interested in doing an ultra low power 'walkie talkie' type circuit cell using basic principles for fun and to improve my understanding of the basics. However, in my research, I generally see FM transmitters and AM crystal receivers, very rarely AM transmitters or FM receivers. I would like to find more of the AM transmitters (voice) and FM receivers.

I am interested in doing a homebrew FM demod similar to a Foster Seeley circuit. However, I'm finding it tough to get good references on how it works exactly . I have seen several different versions of the circuit (not just the 'ratio detector' changes) and would appreciate any references that would help clarify the circuit operation somewhat.

I'd also be interested in information on a simple (very simple as it would be transmitting to a crystal receiver) AM transmitter.

I know that they will give less than ideal performance, but I am more interested in the circuit concepts and playing with them a bit than how great they work.

Any help would be appreciated.

aj

From: Peter Bolch <nc_bolchpe@netcologne.de>
Message-ID: <839utg$n7v$1@news.netcologne.de>
Source record: 64842

Hi,

what is the dynamic range and the resolution of ICOM's PRC-100/1000 RSSI function? I think of using such a receiver as a simple spectrum analyzer/selective level meter if a dynamic range > 40 dB and a resolution (after linearity correction by
software) of at least 3 or 4 dB can be achieved. ICOM told me that the resolution is high. But what is high?

Peter

4925. Guide to the rec.radio Newsgroups

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any amateur radio-related message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the

group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's

headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Hi there,

I'd like to know what is the upper (real) limit imposed on the modulation index
ï¿½ of FM generated
through an Armstrong modulator scheme.

0.1 seems a good guess, but it may be more (or less).

Anybody having an idea ? Or practical experience ?

Thanks,
Vince, F5RCS

I would like to build these filters, notch, high pass, low pass, band pass and
band stop filters. The problem is figuring out the values of the components
to the frequency's I want. These will be used for VHF & UHF frequency's
receive ONLY.

Are there any programs that can do this or a simple way of figuring out these
values. Are there any WEB sites that have some schematics on building
these filters.

Thanks In Advance
Rich

Get a filter designed for a specific frequency and scale to the
frequency of interest by dividing the capacitances and inductances by
the ratio between the desired frequency and the original frequency.

>These will be used for VHF & UHF frequency's receive ONLY.

Especially on UHF there is not much point of using lumped components,
but at these frequencies quarter wave and half wave sections of
transmission lines are generally used to construct various resonators.
Thus, you need a program that also handles transmission line segments
and not just R, C and L lumped components.

4931. Re: 70cm antenna?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-16 00:00:00 UTC
From: Jim <jdport@concentric.net>
Message-ID: <38590999.D92C20C9@concentric.net>
Source record: 64849

A quarter-wave spike antenna for 440 is only a fairly stiff piece of wire about 6 inches long, and provides a fair match to 50 ohm coax cable. Use of most any coaxial bulkhead for the vehicle roof (BNC, SO-239 "UHF", etc) allows you to just use a mating male connector for the base of the quarter-wave.
A J-pole is fairly easy and very effective as well on 440:
(copper clad welding rod works, as does brazing rod)

| Total length of long side of the 'J' is 3/4 wavelength @ 446 MHZ or 19"
| | Length of the stub or short side of the 'J' is 6.3 inches
^ -- Short the bottom of the 'J' together; space the two rods about 1/2 inch or slightly less
-Attach your 50 ohm coax to the lower part of the stub, try about 1/2 to one inch from the bottom for starters.
Using a UHF (!) SWR meter, carefully slide the contacts up and down to achieve minimum reflected power.
Conversely, attaching the coax (shield to one side, center to the other, 'polarity' doesn't matter) with spots of solder and adjusting the spacing of the lower stub often results in a better match.
This whole antenna can be the upper end of a longer welding rod, and the base of the antenna below the shorted stub can be mounted in any fashion you find effective. The J pole is essentially an end-fed dipole, and the ground plane below it is of minor importance, so it can be mounted most anywhere on the vehicle, of course the best place being "high and in the clear".
The worst part about J poles is that the coax coupled connections will wear with time and need to be repaired occasionally, but they are very effective antennas. The same adage applies to mobile antennas as does to fixed antennas: If it stays up and undamaged all winter, you don't have it high enough!

It will depend on how much 3rd harmonic is acceptable for you.
The ratio wanted to distortion components is given by: (□/4)/(1-□/4)
See details at http://www.comms.eee.strath.ac.uk/~ike/ug/325/slides.htm
by clicking on 'PM and FM generators'. You will get a .pdf explanation.

4933. Re: homebrew FM demod...

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-16 00:00:00 UTC
From: Jim <jdport@concentric.net>
Message-ID: <38590D28.E70D8F13@concentric.net>
Source record: 64851

You remind me of my early attempts to get in on the then-burgeoning 2 meter FM activity in the early 1970's.
I built my own walkie-talkie using a 3 X 5 X 7" Bud minibox with a 1 watt VHF engineering 2M FM transmitter strip paired with a very simple 2 Meter converter that outputted to ~1600 KHZ(!), i.e. the broadcast band.
It used a simple AM transistor radio as the tunable IF, and with slope detection it actually worked rather well. With this arrangement there was very little background noise coming out of the speaker when no signal was present, thus squelch control was unneeded. I modified the AM receiver with a reduction-geared tuning capacitor that allowed much better tuning control, and it was very stable. When the set was tuned for optimum audio (just off either SIDE of the "right" frequency for slope detection of FM signals), it would stay on that frequency all day, or almost, as the battery pack slowly declined.
Like most of my projects that were later junked and cannibalized for newer toys, I wish I still had the thing, just to show how effectively cheap, easy "junk" can work. The rig was light enough I even put a belt clip on it and rode around with it on my bike between classes in college at NMSU.
Nowadays I have a very small duo-bander that has thousands of channels, great audio, selectivity, etc..... but I don't get the incredulous looks I used to get with my "homebrew" aluminum-box HT! Nobody ever asked if I was a cop, or even a CB'er, with that thing..... <sigh>

Message-ID: <38592DC5.2A29D712@agilent.com>
Source record: 64852

You didn't mention frequency ranges...

You can get ICs that will do practically all the active parts of an FM receiver in one IC. Look for cordless phone ICs. I think Motorola still has those and didn't move them to "ON Semiconductors". They also have some transmitter-related chips, including a pair of ones that will do both AM and FM. Seems to me they are MC13175/13176. AM is quite common in transmitters for remote control...the little garage door opener type. Most of them are just on-off keyed, but there are chips out there (like the Motorola ones) that will do linear modulation.

IIRC, the Foster-Seeley detector works through a frequency-dependent phase shift through a lightly coupled RF tuned circuit. The phase shifts up and down as you move off the center frequency. By feeding a center tap on the coil with a signal shifted 90 degrees from what's in the tuned circuit at the center freq, you get the same RF voltage at each end of the tuned circuit. Rectifying that and subtracting gives you zero. But...if the phase shifts (which it does as you change freq), one side gets more net RF voltage and the other side gets less. Draw a vector diagram...one vector from (0,0) to (1,0) say, representing what's fed to the center tap. Then one from (1,0) to (1,1) representing the voltage in the upper half of the tuned circuit, and one from (1,0) to (1,-1) representing the voltage in the lower half. The net on each side is a vector of length sqrt(2), and rectifying (to get a "DC" representation of the magnitudes) and subtracting yields zero. But if the phase changes, the upper might go from (1,0) to (1.1,0.9) and the lower from (1,0) to (0.9,-0.9) Then the lengths are different...longer on the upper and shorter on the lower...and the difference is no longer zero. Similarly if the phase shifts the other way, the upper gets shorter and the lower gets longer, giving a difference in the other direction.

See http://www.vintage-radio.com/rts5556.htm for a circuit with some polarities labeled. Refer to figure 5a for my description in the previous paragraph. The coil feeding the center tap is coupled tightly to the primary, and the tuned secondary is coupled more loosely, to get the phase shifts.

It seems like almost all the IC detectors use a quadrature method...OK, probably not all, but an awful lot of them do. They are very common and inexpensive.

If you're willing to not build totally from scratch but modify an existing circuit, you can often pick up pager receiver modules for a very low price. That's much of an FM receiver right there...and a pretty capable one at that.

Cheers,
Tom

I'm not aware of a web site that really covers the subject you want in enough detail to do you any good. There are lots of filter design books, though, ranging from very theoretical to very practical. At VHF and UHF, depending on the bandwidth you want, lumped components may be appropriate, or you may need to consider helical or coaxial or cavity resonators. If you're making a lot of them, you can consider other technologies like surface acoustic wave, too--but of course those aren't very practical for one-off homebrewing.

You might find some web info on helical resonators...but please be aware that people fill whole books just with practical info about helical resonators and how to build filters from them. If you're interested in books, let us know...I can come up with at least a couple recommendations for decent practical ones. The ones I'm thinking of do assume familiarity with RF circuits (for RF filters) and some math background. One includes algorithms that are easy to implement on a calculator or spreadsheet.

Cheers,
Tom

There are complete resolver/digital converters available, but they are pretty expensive. Analog Devices, CSI, DDC, and Burr-Brown all make them. I found a few CSI units surplus a few years ago. Synchros are very nice devices, but they can be somewhat difficult to use on a hobbyist level. You may want to consider replacing them with optical encoders for a direct digital interface , or precision pots and A/D converters.

4937. Re: Speaking of TEK, why the 5000?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-16 00:00:00 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <385945AB.CE9438BF@eznec.com>
Source record: 64855

The 5000 series was particularly popular with educational institutions, and for two primary reasons. One was the price, which was considerably lower than the expensive 7000 series. The other was the interchangeability of plug-ins. One mainframe could be used as anything from a spectrum analyzer to a logic analyzer, in addition to a wide variety of scope configurations. And all this without having to physically move mainframes around.

An interesting side note -- either the first or second real-time sampling scope Tek produced was in the 5000 series. I was in the 5000 series design group for several years and designed some major portions of that scope.

From: Tom Bruhns <tom_bruhns@agilent.com>
Message-ID: <385949FE.CCD9089@agilent.com>
Source record: 64856

Yes...resolvers normally just have a pair of outputs, if you excite the rotor winding. The amplitude of one is |A*k*sin(theta)|, and the other is |A*k*cos(theta)|, where A is the input amplitude, k is a proportionality constant, and theta is the shaft rotation angle. You can precision-rectify the outputs, convert them to digital, and then compute theta as the arctangent of the ratio of the two values. That doesn't resolve the quadrant. For that, use a synchronous rectifier AKA double-balanced mixer to preserve the signs of the sine and cosine terms, and resolve quadrant with that. The DBM LO input comes from the excitation, and it's handy to provide a phase tweak if you want good accuracy.

Similarly, a synchro has three stator windings which will deliver three phases, 120 degrees apart from each other, and you can do the same sort of thing with them. Each outputs an amplitude which is proportional to the sine of (the rotational angle plus a constant), given constant excitation of the rotor winding. If you ratio the outputs, you can avoid having to know the excitation amplitude and proportionality constant.

I expect the proportionality constants to be quite accurately the same for all the windings of a given unit. You will want to excite with a sinewave of the rated amplitude and frequency for best accuracy, though you can probably get by with lower frequency if you proportionally lower the excitation amplitude.

Having recently done something akin to this with a PIC microcontroller, I can imagine making a little unit with just a PIC (one with ADC built in) which would "talk" to the computer via RS-232 and tell it the angle. The PIC can effectively do the synchronous rectifier in software. About all it might need is input scaling to match the ADC range. It could probably even generate the excitation, to feed to a little IC power amplifier chip, if excitation was a problem. PICs aren't real fast computing things like multi-word-precision sines and cosines and arctangents, but that part of it you shouldn't need more than once a second anyway, if that often.

Cheers,
Tom

My guess is that anyone who can successfully build a 100 watt amplifier from
a schematic
could easily earn a legitimate amateur radio licensee.

What is and who makes the "Duracom" power supply? I see references to
them but I have never seen an ad or any specs on the make. I have also
seen it referred to as a "Duracomm."

Thanks.

Duracomm power supplies are (or was) sold by:

Duracomm Corp.
2119 Atlantic
North Kansas City, MO 64116

The Company is/was owned by John Fuhrman. I believe he is (or was) a HAM. I have one of his switching 22 amp power supplies and it has worked great for me for a number of years and is still in use. When I first got it, it had a lot of noise which I could hear in my receiver. I wrote John about it and he had me send it to him. He totally cleaned it up, and sent it back to me at no cost to me. He is a great guy, and his power supply has never failed me. Oh, the little switching power supply that TenTec used to sell for the Scout was a Duracomm, so I have been told.

I don't know if he is still in business. I have not heard from him in a number of years.

James (Jim) Parsons, K5ROV USAF, Ret. Ham for 58 yrs.

4948. Filter/Ground question with HT

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-17 00:00:00 UTC
From: tmelcon@mit.edu
Message-ID: <3859c03c$0$22859@senator-bedfellow.mit.edu>
Source record: 64866

I have recently been attempting to build filters for an HT, and I have been less than successful. I've been using lumped components, for the simple reason that that is what I know how to design.

I shall describe the simplest design I tried which demonstrates behavior I cannot understand. I am using BNC connectors on the radio and antenna; I insert whatever I'm testing between the radio and the antenna in an aluminum box with two panel-mount BNC jacks on the ends.

When I connect the signal pin from the antenna to the ground via a wire, and connect it to the signal pin on the radio via a 100 ohm resistor, very modest attenuation is achieved (don't recall exact amount). I would expect this to eliminate all signals altogether, and I am confused. When the 100 Ohm connection to the signal pin on the radio is removed, there is no signal.

This seems to me to indicate that the BNC ground on an HT antenna connection (I'm using an ICOM W32, in case it matters) serves only as a shield and does not in fact serve as an electrical ground. Is this the case, or am I missing something? I would appreciate any insight you could provide.

-Terran

> >
> > -- jm

Is there a typo here? The manual that came with my 545A has a copyright of 1959. That makes it as old as I am. It does not seem like 30MHz is too shabby for 1959. Considering that many at the time would have been happy to have an oscilliscope, and if they got one it would be AC coupled and bandwidth in the KHz range, 30MHz seems downright great.

As for the biomedical field, I got mine a few years ago when someone found it being thrown out at a hospital. He didn't want it, so I got it. It was nice and complete, with two two or three plug-ins, a manual for the scope, and a manual one of the plug-ins.

I saw another Tektronix scope in an alley a few months ago. I recognized it as such, but didn't get close to completely identify it. They are not the sort of thing that you haul home without transport, especially if you've already got one at home.

4951. Qusetion about TEK 7000, was: Speaking of TEK, why the 5000?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-17 00:00:00 UTC
From: "Dr. Rainer Meergans" <dr.r.meergans@bigfoot.de>
Message-ID: <945424703.1815144055@saturn.heiden.de>
Source record: 64869

Nowadays you can buy a (used) TEK7000 here in Germany for about 900 $
(Mainframe and 2 x 7A26, 1 7B70 AND 1 7B85) resulting in 200 MHz Bandwith.

Is it a good buy, compared to portable Scopes like TEK2246 A or 2235, wich seem
to be not so old and cost about 700-800 $? I would mainly use it for
HF/VHF/UHF use, no digital circuits.

Source record: 64870

Hello Everyone,

Due to a lack of interest in photography these days, I would like
to swap the following quality kit for a HF rig, plus cash either way.

Canon EOS-5 Body fitted with the following,
Canon EF 28-105mm f3.5-f4.5 latest USM lens + EW-63 hood.
Canon vertical grip VG-10.
Canon remote switch 60-T3.

All the above kit is boxed and in mint, showroom condition
and has had less than 10 films through it!!!
It cost me close on £1000 last year, now it's worth between
£450-£500 on the second hand market at the moment.

Please reply direct to the address below.
All the very best.

john@mm1dsp.freeserve.co.uk

4953. WTB Kenwood 8830KHz 2.7KHz Filter

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-17 00:00:00 UTC
From: ss <ssluz@worldnet.att.net>
Message-ID: <385A2D59.D6AAA673@worldnet.att.net>
Source record: 64871

I'm looking for the wide 2.7KHz ssb filter that comes stock in many Kenwood radios such as the TS-820/830/430/440/450/690/930/940.

The IF freq is 8830KHz. The exact size or pinout doesn't matter since this is going in a homebrew project.

Thanks;

Steve

Another approach is to build a good VCO for 88-108MHz, divide its signal
by 2 and phase compare it with the original one. The stability will be 2
times poorer than the original one but the noise will be strongly
dependent on the VCO design, components quality (I'd suggest a
plastic J-FET like J-308, 309 or 310) and loop bandpass. Normally it is
difficult to improve the low frequencies noise.
If you cannot phase compare on those frequencies, you may divide both
VCO's frequencies before the phase detector.

Many applications don't require a high bandwidth, thus there is a need for a more economical scope main frame series. One boatanchor scope that's showing up is the HP-140/141 series. These guys will accept a WIDE variety of specialized 1400 series plug-ins such as swept frequency, TDR, the 8552/8553 spectrum analyzer, as well as the standard 20 MHz dual trace ones. While not as light weight as the current crop of solid state 20 MHz scopes, it's certainly a lot smaller and much less heavy as the old Tek 545 :-)

Hi Terran,

If I understand your simple circuit correctly, the mistake you are making
is in assuming that a piece of wire from center pin to ground is a short
circuit at RF as it is at DC- not so.
A 1" piece of wire has about 20 Ohms reactance at 2M- far from a short.

Check our WEB site for some near ideal V/U filters. For instance,
Insertion loss at 146 MHz= 0.24 dB, Return loss >25 dB and loss at the
pager freqs (152-153 MHz) > 50 dB. http://www.parelectronics.com

Hi Chuck,
Texas Towers used to carry aluminum- may still. Remember you are not looking for 2000 or 3000 series- this stuff is dead soft and takes a set easily. You should be looking for 6061T6 alloy. 0.058 wall extruded tube telescopes beautifully with 9 mil clearance.

Pages 43 - 45 of the ARRL Solid State Design book covers freq
multipliers.
There's a passive one using a broadband xfmr but you loose LO Power at
2X
but circuit is very simple. Diodes are fed to at least a 2 stage BPF
tuned to 2X. The 1496 would not work well (if at all) that high in
frequency.

>the only figure of merit, but am all ears.

The 5000 series was rather strange in that it was made up of 2
completely different performance families that just looked the same.
There was a 2.5 MHz family and a 60 MHz family. I have a lot of time
on a 2.5 MHz dual beam 5000 that was really very nice. The fact that
you could get a wide variety of plugins, for both the vert amps AND
the time base, made these scopes very nice.

There was also the 560 series with a max bandwidth of 10 MHz that also
had both vert amp and time base plugins.

Of course many of you out there actually NEED 75 MHz, but I'd have to
admit that the vast majority of stuff I have ever looked at came in
under 20 MHz.

From what I saw on the winradio web site, it comes with spectrum analyzer software. Unless that in in adequate for you application, looks like your there.

I recently bought a used Kenwood TR-7850 (which I'm still looking for a mounting bracket for, BTW.) This rig uses 4-AA NiCd batteries to maintain the memories. I pulled out four very old Radio Shack NiCds that had all vented, leaving deposits of white crystals around the ends. I tried hard to keep this crud from falling into the radio when I removed them, and I brushed most of it away...should I be concerned about further corrosion?

Source record: 64886

Actually, my posting was a little premature. With a little more time
and effort, I DID manage to come up with a good VCO that works directly
at 88-108. Stability is better than I would have dared to hope for from
the simple, uncompensated circuit I used. It's lots better than the
Mini-Circuits POS-150 module that set me back 16 bucks :)
My VCO meanders back and forth about 1.5kHz above and below the nominal
frequency over the course of several hours... certainly good enough for
my application (wideband FM). Of course, this decent drift performance
was observed at a constant temperature.

Still, I'm glad I posted because the responses have been very
educational. I have years of experience in electronics, but I'm fairly
new to RF design.

Hi,

I have one EEV (English Electric Valves) C1111 valve for sale. This is the same as 715C by WE and very close to the 5D21. A very powerful pulse tetrode, but can be used in audio, too. The valve is in its original packing and unused. Very nice and in mint condition. Top quality.
Best offer.

I heard that it is NOT a good idea to connect both channels (Left and Right) of the sound card's line output to the Rig's mic input. It might cause distortion. (On the other hand, I heard it doesn't matter whether the rig's speaker output is connected to both channels of the sound card's line input or mic input).

Is this true? Will there be distortion?

I also heard if you just used a mono plug for the sound card's line output (or speaker output), it will short out one of the channels and may cause distortion. It is best to use a stereo plug and only use one of the channels. Is this good advice?

...If someone were smart, the soundcard driver software could be re-written so each audio channel were a different "port" thus creating a dual-port virtual TNC. Of course, there would have to be two PTT circuits, two DSP engines for RX, etc. Then the above situation would be moot.

Dear All,
I am rebuilding a G2DAF SSB TX, a design from the UK which was a common home build in the 60s.

To get this going again I need the following:

6146 RF Tetrode
11.5 MHz xtal
11.75 MHz xtal
1.547 MHz xtal
2.453 MHz xtal

Can anyone help out with these, especially the xtals. I can probably cope with most any case for the XTALs, the 1.547 and 2.453 would be best in quite large holders whilst the 11.5 and 11.75 would be best in smaller ones. The pins on the low frequency ones are 0.75 inch apart whilst the high frequency ones are somewhere around 12mm or 0.5 inch apart.

Regards

Robin

You're quite right about this, of course, but the original post asked about the 5000 series (see the subject line), not the 500 series. This thread then got diverted before you got to it.

The original question was something like, "Why did Tek introduce the low bandwidth 5000 series long after the nice medium bandwidth 500 series scopes, like the 535 were already on the market."

It is NOT a good idea. When you connect the two outputs together you are shorting the outputs. Whether this causes any distortion depends on the sound card output circuit design and how well balanced the two outputs are. If, for example, you had the mixer balance all the way to one side, the dead side would attempt to short the output of the other. The output impedance *may* be high enough to prevent distortion or damage but you never know how it was designed. It's best not to do it and there's no advantage to it that I can think of. In pro audio a resistor is often inserted into each channel in order to provide a "resistive combiner" circuit to feed a stereo channel into a mono channel. With PSK31 both channels have the same signal so there's no reason to do it.

> (On the other hand, I heard it doesn't matter whether the rig's
> speaker output is connected to both channels of the sound card's

> or mic input).

It doesn't matter because because you are shorting two inputs. The load impedance drops to one-half but it's still plenty high enough not to overload the receiver's output.

> I also heard if you just used a mono plug for the sound card's line
output
> (or speaker output), it will short out one of the channels and may

Good advice! A mono plug will short one output. It may not cause distortion in the other channel, but it's never good practice to short an output unless you know for sure that the circuit design can handle it.

Bob,

Many thanks for the info.

I understand that it is alright to fed both channels of the sound card line input.

BUT I heard it is a different story for the MIC input. I was told that the mic jack on a sound card is a MONO circuit but uses a STEREO JACK with one channel carrying the audio and the other carrying a DC voltage for the mic. It was suggested that I use a STEREO connector and ONLY use the TIP which carries the audio. (AND DON'T USE the RING which carries the polarizing voltage).

Since HAMS like me sometimes plug cables in the wrong jack (especially if the mic and line input jacks are beside each other), it sounds to me like a good idea to only use one channel carried in the tip (even if you PLAN to connect it to the line input jack where it doesn't matter)

Any thoughts?

Rob

I'm a newly minted no-code tech. I would like a real inexpensive
first radio. I have built electronic kits before. So if the design is
simple I can etch a pcb board and work from drawings. More complicated
rigs, would be best to go the kit route. Or I would be interested if
there is some decent used equipment. I just want a real cheap rig to
get started, spending hundreds for the new high powered commercial stuff
doesn't interest me.
I would really be interested in a card to plug in a computer. I
found the winradio card, but it costs too much and is only a receiver.
The goal is cheap, cheap, cheap.
Since I only have uhf privileges, the radio has to operate on 2m,
6m, or 220. thanks. Please send me e-mail, since I only check this
group once in a while.

Hi Cliff,

Yes, both the mic and line input jacks of a sound card are stereo jacks.

The line input accepts a stereo input and uses the tip and ring for separate channels (e.g. left and right). You can supply a stereo signal to the computer ONLY using the LINE INPUT. In Ham radio applications, we typically only supply a mono audio output from the rig to ONE of the channels. (Even though you could connect to mono signal from the rig to both channels - BUT I do not recommend this approach -- see below)

The mic jack also uses a stereo jack even though the audio input is mono. The audio is on the tip. The ring is used to supply a DC voltage from the sound card to the mic. The DC voltage is used by some computer mics. I checked my computer, the ring supplies 3.5 mV of DC. Not very much but it is there.

IF YOU PLAN TO USE THE MIC INPUT JACK TO RECEIVE THE RIG's AUDIO OUTPUT, DO NOT USE THE RING (since the ring supplies some DC!)

HERE IS THE SAFE APPROACH: Wire the line input jack of the sound card using a stereo jack and ONLY using the tip. DO NOT CONNECT the ring (which is used by the other channel)

Why is this the safe approach?? Well Hams like me can easily plug in the cable to the mic jack by mistake especially considering that the mic jack is beside the line input jack. Using this approach to wiring the jack, you can safely connect your cable from the rig's audio output to EITHER the LINE INPUT or MIC of the sound card.

I think I have it all straight in my mind know. Thanks for all the input.

Does anyone else have any other ideas or comments?

Thanks for the info...

Actually, that web site was one of the places I had looked for info already.. very cool to hear from the author :)

I would like to stay away from the IC solution at the moment so I can play with the parts etc to see the effect of everything. I'm trying to do a 'crystal set' for both AM and FM so I can have a low power receiver for both BCB (AM and FM).

Would you know why FM demod isn't normally done with an allpass network? It seems to me it would be easier to tune and easier to integrate... eg: 'most' IC solutions have an external quadrature circuit and a phase detector.. but why not use an allpass with a designed 90 degree phase shift at the centre frequency?

For older radios, would an allpass not have been easier to tune than the Foster Seeley or ratio detector circuits? The transformers look rather complex and lossy.. and they must have been a pain to keep tuned...

Any further comments?

aj

No typo. The Tek 500 series originated long prior to 1959. I don't have it at my fingertips, but as I recall, the 53x series was WWII vintage.

Several other vendors produced these under government contract. (The only one I remember is LeCroix, now LeCroy. I assume the name was changed to not off-put potential customers that didn't know how it was pronounced.)

Nice hardware. I owned a 555 (dual beam with separate power supply) about 20 years ago. For the price, it was an oustanding instrument. Most of us couldn't have personally afforded the current technology of that time (even single beam).

It doubled as an excellent forced air heater. Actually used it on rare occasions to heat part of our apartment. :)

4993. Need help building an ELECTRET mic for PC

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-19 00:00:00 UTC
From: Gene <genes@texas.net>
Message-ID: <83j55netd1@nnrp1.deja.com>
Source record: 64761
Cross-posted to: rec.radio.amateur.homebrew,rec.audio.pro,rec.audio.tech

I want to see if I can use the +5v from my sound card's MIC IN to power a tiny ELECTRET MICROPHONE element. (I have not purchased the mic element as of now.)

I need a wiring diagram to connect the following items:
- a 1/8" male PC stereo jack (Radio Shack Cat. No. 274-284C) which has Ground and two connectors for a total of three wires total that attach to it. When this 1/8" stereo plug is plugged into the Soundblaster AWE64's MIC (RED) connector, the readings that I get are as follows:

with the BLACK(-) lead from my digital volt meter connected to the plug's GROUND and the RED(+) lead attached to the connector on the 1/8" plug that is the "TIP" of the plug and the center-most solder connection
on the back of the 1/8" plug, I get a reading of 0.0 mV.

with the BLACK(-) lead from my digital volt meter connected to the plug's GROUND and the RED(+) lead attached to the connector on the 1/8" plug that is the connector in the middle of the 1/8" plug - and the OUTSIDE solder connection on the back of the 1/8" plug, I get a reading of + 5.06 Volts (not mV).

I want to wire from the 1/8" plugs 3 wires (GROUND, +5.06V (DC - I assume?) and what I think must be the SIGNAL line ?)
to the RED & the GREEN wires on a "to be determined" ELECTRET MICROPHONE ELEMENT.

My goal is to build s QUALITY "POWERED" microphone for my PC that has a LOT of volume & sounds a lot better than the junky PC mics that I have tried.

As far as the metal housing, spit guard, etc. - I can handle that ... ;-)

THANKS in advance.

You may reach me at:

Source record: 64766

Hi Jason,

How about a Morse code identifier. Make a binary counter to step through the addresses. Program the EPROM to output a "1" to turn on an audio oscillator and a "0" for silence. Three "1's" would make a DAH and one "1" would make a DIT. One "0" between dits and dahs, three"0's" between characters, five "0's" between words. For example here is my callsign -

11101000100010101010100010111000101110101

NE5AL

With an eight bit EPROM you could program eight different messages and have a selector switch. If you just send a callsign there will be a lot of empty space in the EPROM. If you look in some old ARRL handbooks or FM and repeaters handbooks, this circuit should be there - very popular in the late 70's and 80's.

73,

Neal N.

On 16 Dec 1999 10:56:12 EST Jim <jdport@concentric.net> wrote in rec.radio.amateur.homebrew:

: I built my own walkie-talkie using a 3 X 5 X 7" Bud minibox with a 1 watt
: VHF engineering 2M FM transmitter strip paired with a very simple 2 Meter
: converter that outputted to ~1600 KHZ(!), i.e. the broadcast band.
: It used a simple AM transistor radio as the tunable IF, and with slope
: detection it actually worked rather well. With this arrangement there was
...

It was nice to see your note. I did something similar, but a little more elaborate. I used one of the VHF Engineering strips as a transmitter and homebrewed a crystal controlled converter with output from 14 to 18 Mhz. I had an output jack so I could feed this i.f. into a communications receiver to listen to weak signal activity on the low end. For f.m. reception I had a tunable 2nd converter with output at 1600 khz, and used one of the f.m. detector phase-locked loop chips to make a detector. It worked rather well, the tunable converter was pretty rugged and stable, and I could stay on frequency quite well. The box was about the same size as yours. I used an external microphone and carried the unit with a collapsible whip antenna attached in an over-the shoulder pouch or hung it under the dash in my VW beetle for mobile work.

My major regret is that this marvel, along with some other electronic junk, got stolen from a locker in the basement of a house where I lived as a renter for a while after getting divorced. No way could I get the police interested in what sounded like a piece of junk and was in any case not identifiable by any brand name or serial number. The experience tempered my enthusiasm for big homebrew ham projects.

This project was done in the mid '70s and I used it until about '85. It attracted attention whenever I showed up at a ham event, for sure. I don't think I ever encountered anyone else with homebrew 2 meter f.m. gear, outside of repeater operators.

Back to the original query in this thead: The little chips that implement a.m./f.m. rceivers are hard to beat for simplicity and performance. But if you really want simplicity you might try using a superregenerative detector. They are incredibly sensitive and can do a good job of slope-detecting wide band f.m. at f.m. broadcast frequencies. Of course they have several problems -- they have an "anti-squelch" effect due to the very hign amplification of noise in the absence of a carrier, and they can radiate a wide interfering signal on the receiving channel.

Now, like many old ideas I suspect this one merits being revisited
with newer technology. I suspect a simple crystal controlled
downconverter to a superregen operating on a frequency in the
h.f. range would solve several problems. First the bandwidth of a
superregen in the h.f. range would be narrower and more suited to
slope detection of the f.m. bandwidths used by current ham
equipment. A converter isolating the detector from the antenna would
also help prevent radiation from the detector, and a modern
transistorized detector circuit would operate at a much lower power
level than the old tube circuits used by hams in the 40s and 50s. And
a squelch circuit based on detection of high frequency audio
components is relatively simple to devise.

RT is apparently using "destructive copy protection" where a sector of the original disk is unformatted and the software searches for that condition before accepting as original. This will rule out the image file being used to install from the laptop's hard drive.... The sharing across the network of the floppy sounds like the best deal going, unless RT systems put a block on accepting a redirected source.

If the ADMS-x software functioned as well as the copy protection, it would be nice.....

My best guess is that they use a check for a specific block. I have
used total disk copy programs like the old game hack programs with
reasonable success to archive the floppy. What is a real PITA is if
you defrag the hard disk you can disable the program.

Not withstanding what some west coast wags say the "E" version does
have some signifigant warts. I agree if RT spent as much effort on the

core code as they spend on copy protection it would be a truly great
piece of software.

There's a hamfest in Gainesville, Florida on January the 7th, Bob.

There are some great places to see, but many Test Equipment places listed. They've got SOME test gear at SKYCRAFT in Orlando, but the prices are VERY steep there.

You can check all the other places listed at:

http://www.geocities.com/CapeCanaveral/Hall/8701/mega/boatanch.htm

Look at the Alphabetical listing as well as the listing BY STATE at the bottom.

Cheers

Does anyone have any experience converting Commercial Radio microphones over to amateur use?

I have both a G.E. mobile mic and a G.E. (made by Shure) desk mic, that both have unshielded wire (strange) and the mobile G.E. has some sort of single stage pre-amp.... Or maybe it is the power supply for a condenser mic? Not sure.

Can anyone advise?

It's getting old driving around talking with a Shure 444 on my HF rig! He he!

Thanks chums

>part with?
>
>Thanks.
>
> I know you said you were looking for the 350's. I see them at the
Timonium, Md hamfest by the dozens every spring. 25 to 50 dollars
depending on condition. My comment is this, The 350's are so
difficult to cool, the fin area is reduced due to a fatter anode.
the air passage through the plate radiator area are smaller. Just
use 250's. They are cheaper, easier to find, and when it comes right
down to it, 350's really don't give you anything more.

Hi Bob;

In Orlando, there is a place called Skylab, or, skytech, I
forget which. As we call it skyjunk for short. They have most anything
you could ask for, and more at reasonable prices. They have test
equipment also.
As to hamfests, i'm not sure. Are you looking for anything in
particular?

Thanks for the replies...

I sense that there may be a reason to stay away from a home brew Foster Seeley or ratio detector as no one has mentioned that method yet :)

If I create a crystal AM detector circuit, no power used, I'm thinking I can just detune the input slightly to get FM demod correct? trade off is output signal level, correct?

That would be the ultra simple way to do what you guys are talking about ..yes?

remember, at the moment, I'm not necessarily going for high quality, just proper operation, and proof of concept...

aj

I am looking for a 150-250 watt 2 meter amp. I hear there are some surplus motorola amps out there with 4cx250s in them. I am wanting this amp for a two meter repeater. I know I will have to cut the power back to a safe level and even place cooling fans on it for repeater use. My final goal is to come out with 75-150 watts of power. I would also consider a solid state amp if it would handle the job. does anyone know of where I might locate such amps and also Im looking for your reccomendations and ideas on this.

Thanks, Tom WA5KUB please email me at tcmedlin@cris.com

Source record: 64791

Hello All,
Well, I bought an SB-200 that "just needed a little work" and found out why
I got such a good deal. The bandswitch is toast. I need the front and
middle wafers for an SB-200 bandswitch.

Can anyone help?

Thanks,
Jeff Weinberg W8CQ

What you think of idea of realization of radioexpedition on Southern Altai?

Southern Altai - highland is on the board of Kazakhstan, Russia, China and Mongoly.
Land of lakes and waterfalls, mountain taiga and stormy rivers, deserts and snowy peaks...
In time of Soviet Union this territory had been absolutelly inaccessible for foreign tourists (and furthermore for radioexpedition) - in locale
It is not enough of ham stations.

The base camp of expedition is planned to place in region by highest Fastigiums of Siberia and Altai of a mountain Belooha, lake Markakol and Zaisan.

If you were interested by our proposal, we can be found on ranges 21Mhz, 28Mhz call sign UN8JZZ (collective radio station)

I think you are going to have to be a bit flexible in getting your parts. Realize that there isn't necessarily anything special about the brand names you list -- in most cases "generic" parts or equivalent parts from another company will do. The key to successful parts scrounging and substitution is fully understanding the circuit and each of the components. Good luck! Bill N2CQR

Good question. I have a full set too. It depends what type you have, but I have never been able to get them to work well. They take a whip 6ft or so long, tuned to your favourite part of the band. Good grounding to the car body is essential. Don't expect a small car, a Maclaren F1 or a Reliant Robin to work as a ground.

Such a small antenna will be a poor performer. An antenna needs to be an appreciable fraction of a wave length in size to be a good radiator.

I don't think the choice of coaxial cable will make much difference. However, the radiation resistance would be very low and you need to do matching at the antenna, not at the radio.

> but why not use an allpass with a designed 90 degree phase shift at the centre
> frequency?

I 'spose cuz it's so easy to get the 90 degree phase shift with a
lightly-coupled tuned circuit. You want fairly rapid phase shift with
frequency, so that you get good detector sensitivity, so you're faced
with fairly high Q poles anyway; with a single tank, you only have one
thing to tune, not two (or more). Actually, the quadrature detector's
linearity can be improved with something more sophisticated than a
single tuned circuit, but what I've seen is a double-tuned. I don't
recall the details, but I believe it was a Macintosh FM tuner that used
a transmission line as the phase shift network to get extremely good
linearity in the detector. I don't recall if it was really a quadrature
detector, or some other scheme. Tuning a single tuned circuit to the
center frequency is pretty straightforward: just put in a test signal
and tune for zero DC out of the detector. If you have even so poor as
one part per thousand stability, that's only half a kilohertz at 455kHz,
and 10kHz at 10.7MHz. Both of those are small compared with the
bandwidth typically being detected at those IFs.

If you have enough signal, I guess you can do a ratio detector directly
at the frequency of BBC you want to receive...you'll want reasonable
stability there, but that really shouldn't be all that difficult. You
might even be able to make it tuneable over a limited range. Literally
an FM crystal set! (I'll be someone has already done this, and likely
will pop out of the woodwork and add to the discussion...)

>
> For older radios, would an allpass not have been easier to tune than the
> Foster Seeley or ratio detector circuits? The transformers look rather complex
> and lossy.. and they must have been a pain to keep tuned...

Well, by the time that FM receivers became popular, we had a lot of collective experience building IF transformers. I don't recall that re-peaking IFs was required very often! In fact, in an FM receiver, because of the importance of phase linearity, you wouldn't even want someone to be messing with the IF strip unless they knew what they were doing (assuming the design really did pay attention to phase linearity). The F-S or ratio detector transformers wasn't so different from other IF transformers, just different coupling. Just because coupling is fairly loose doesn't mean the transformer is particularly lossy, and in any event, at that relatively large-signal point in the circuit, a little loss isn't devastating.

Anyway, that's my $.02 on the subject...

Cheers,
Tom

<snip>

A 1 Metre loop will have a very low radiation resistance on 160M.
The 2 Metre loop will be more efficient. Use RG8 or some metal
tubing. You might get better results with a multi-turn loop.

Have a look at Reg Edwards (G4FGQ) web site. You can
download his magnetic loop program from there. I can't
remember the URL but there's a link on my page:

IMPORTANT -- CORRECTION -- PLEASE READ

The mic jack on a sound card is a MONO circuit but uses a STEREO JACK with one channel carrying the audio to the sound card from the mic and the other channel carrying a DC voltage to power a mic.

I made a big mistake. THE TIP OF THE MIC CONNECTOR CARRIES THE DC NOT THE AUDIO AS I SUGGESTED IN MY LAST POSTING!

Most people use one of the channels of the sound card's LINE INPUT and do NOT use the sound card's mic input for good reason.

IN ANY EVENT, EVEN IF one is going to connect a cable from a Radio's audio output to the Computer's sound card LINE INPUT, I strongly suggest that one uses a STEREO connector and ONLY use the centre ring which carries the audio to the sound card and the lower ring for the mic ground return.

DO NOT USE the TIP of the connector. Leave it unconnected!

This is the best approach! If you accidentally plug this cable into the MIC jack of the sound card instead of the LINE INPUT, you will not cause any damage to your sound card! In fact, the cable will even work and provide an audio signal from the radio to your sound card!

(If you don't follow this recommendation, you MIGHT damage your sound card. It depends on whether your sound card has any short circuit protection etc)

5049. need design/kit for 50-100w HF amp

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-21 00:00:00 UTC
From: gagnon@gagnon.fakeu-net.com
Message-ID: <385fea37.181848@news.u-net.com>
Source record: 64644

I am looking for a relatively simple circuit (and preferably a kit)
for a 50-100 watt HF amplifier (3.5-30Mhz) for a QRP rig (ie 2-3 watts
input). I am aware of the 1995 ARRL handbook 50 watt circuit design
but this uses rather expensive MRF477 transistors. Anyone out there
know of others?

Larry MW0AWC

I am just curious. Are the big 1/4 inch stereo jacks and plugs better than the smaller mini stereo jacks and plugs? That is, are the big stereo jacks better designed than the smaller 3.5 mm jacks such that the big 1/4 jacks not to"short out" some of the circuits when plugging them in and out of the jack?

Rob

Mica caps are not really needed, unless you plan on transmitting through
it. NPO, type disk caps should do fine.

None of these factors is particularly troublesome with NPO multilayer ceramic capacitors. I've used them with good results for many filters, including narrowband designs. X7R or similar "stable" ceramics are not as good in all these respects, but still are good enough for many applications where bandwidth isn't narrow and/or Q isn't very high. Z5U or similar "high-K" types are very bad in all these respects and shouldn't be used for filters (or much else except bypassing or perhaps blocking).

I just received my Y2K ARRL handbook a few days ago and it has a HF amplifier project using two IRF510 power MOSFETS. I bet you could find those for less that 2 bucks a piece. However, it requires a 28 volt supply to achieve a max output of 75 watts on 40 meters (with 1 watt drive). Output is only about 20 watts with a 13.8 volt supply and 1 watt of drive.

Now I am assuming you need a linear amplifier. If you just need an amplifier for CW, we can come up with class C designs out the wazoo.

Thanks, Tomi. "You have a really neat web site!"

Question:
(1.) I do not see a resistor in the circuit, why not?
(2.) Please advise the specific Panasonic (or?) quality electret mic element part number for the SoundBlaster AWE64 mic using the design below. I want the BEST one for voice recording. Directional, I assume. THANKS

Now I understand why users have such a problem with making applications like Microsoft NetMeeting, etc. work with a "normal PC mic". They simply do not understand that not all microphones are created equal and above all else "not all MIC OUT soundcard ports are created equal". For example, my SB AWE64 "has a DIFFERENT" pin-out from the Compaq 5360 - geesh, the +5 is NOT in the same place! To make matters worse, the AWE64's speaker out is amplified - while the Compaq's is not. What a mess. To make a long story short - to get GOOD voice recordings , I am 100 percent sure that you MUST first get out your old oHm/volt meter & determine where your +5 , Ground & signal are - then you have to build a powered mic of some sort to FIT your specific sound card. The mics that most folks buy for a PC are junk - "that, in some cases, do not even work because of pin-outs". My testing indicates that until you do the above - you simply do not understand the problem. I will build a few electret mics of different designs (using my SB AWE65's +5) - and do the same for the Compaq (which also has a +5). I will try & remember to post the results. BTW: I "think" that I found the solution to amplifying the un-amplified "speaker out" from the Compaq - it's a NEC Drive Bay Amplifier Equalizer" - will install & test it shortly. It connects directly to the AWE64 & provides up to 6 amplified stereo speakers, a woofer out port, & a LOT more. Never heard of it until yesterday ... we'll see.

>audio signal from the radio to your sound card!

>(If you don't follow this recommendation, you MIGHT damage your sound card.
>It depends on whether your sound card has any short circuit protection etc)

I presume that anything that uses a (mini-)jack connector has some form
of short circuit protections, as these connectors routinely short out their
connections when plugging in/out or fondling with the connector to find
the spot of good ground contact.

Normally there is a small regulator on the card to provide the voltage,
and it is short-circuit protected. It could run a little hot when left
shorted all the time.

A better recommendation seems to always use AC-coupling on the soundcard
inputs, so if you use a transformer, put a (say 1uF) nonpolarized cap
in series. Or a resistor of sufficient value to reduce the current,
and small enough in relation to the input impedance. 4k7 or so.

In fact, this is always a good thing to do. When I make connections
to transceivers for 9k6 modification, where AC coupling is a bad idea,
I always put in a small series resistor directly at the connection point,
to avoid damage to the transceiver when the outgoing lead is shorted to
ground or to small voltages like +5 or +12. Better to have some percent
of signal loss than a blown-out 3357.

I don't have all the information at hand, but as I recall
you must have a unit IC-10B which plugs into the radio;
this requires some digging in, but no soldering. etc. Then
you need an external unit IC-232C. Then some simple
software is required. The two units can be somewhat
expensive, and may have to be obtained used. Some homebrew
units have been described to be used in lieu of the IC-232C
The fact the manual says nothing about these units or
computer interfacing is a clue to how old the TS-940 is
getting to be. I think I went to a company who handled
Kenwood's older parts for the IC-10B. Check with Kenwood
for availability. If I can be of help, let me know.

Apple avoided this problem by using a modified (longer) plug for the
microphone. The DC power is at the tip, but since the jack is designed
for a longer plug, a normal plug won't reach it. The center ring is
longer, and connects to both left and right channels, for blended mono
recording. Yet a stereo plug could also be used, for true stereo
recording.

I have had one for several years. It is a great device and is a good tool
for receiver and preamp work. I have used it to also confirm that I fully
suppressed a troubling 6 meter harmonic in an amplifier.

With the freq display I find it a neat full coverage radio too!

Is Soundblaster good enough to tell.
This dynamic mic circuit is not going to work well
with an electret.

If your mike is set up that way then you do want to use the tip only and you are right, it's best to do it that way for consistancy. I don't know of any benefit to feeding both channels.

Tom,

I for one would be interested in references to books on using
helical filters. I am very impressed by the intermod resistance of
my one radio that has one, and would like to make an accessory to
switch one in and out of line on other radios. (Kind of hard to get
NOAA Weather Radio on the 2m receiver with a filter in line ... but
is QRO enough it would probably bleed through :-)

I would guess that in most sound cards the mike bias voltage is
supplied via a large value resistor so that shorting it to ground
will not do any damage to the sound card. In most cases the drive
impedance of your receiver's audio circuit is low enough that there
won't be any problems there either. Still, it's a good practice to
not connect the mike tip connection.

Ramsey has a "good and longstanding reputations for selling inexpensive, quality educational kits and components"?

The raid on Bill Cheek, for possession of Op-Amps with intent to distribute, is absurd -- and given his health situation, cruel and pointless. Regulations on reception of un-encrypted broadcasts was previously (act of 1937) recognized as absurd and unenforceable in the large, so they used to regulate release of privileged information, which is actionable. This new law and new interpretation is baloney.

But this is the first time I've heard of anyone other than Ramsey refer to Ramsey as puveyors of quality goods. I've never quite understood what loophole it was that kept their kits for building devices that one could only vainly hope might comply with FCC emissions regulations from being open-and-shut illegal.

1/4-inch plugs & jacks have the same basic construction thus the same problem. Sound system instrument cables sometimes use a 1/4-inch plug which contains an internal switch to short the tip and sleave until the plug is fully inserted. This prevents hums and buzzes while connecting cables.

Rob wrote:
>

My 2 cents worth. Since I get reports of 25 to 32 on my signal quality, I feel my method has worked.

On both tx and rx I am using the only the tip (and sleeve) of a stereo connector.

On my IBM Mwave audio card, I have connected ONLY the Tip. Due to the audio level available, I am using the MIC input to the card. THERE IS 5 V DC ON THIS TIP. Until I isolated it (capacitor) it caused the squelch in my radio to act funny.

I use a Transformer with a capacitor in the transmit line to keep the radio mike bias dc from saturating the transformer secondary. The transformer is wired to JUST the Radio MIC + and - on the radio side, and to the PC Audio out, AND THE PC OUT AUDIO NEGATIVE INSIDE THE SHEILD of the BALANCED type wire I used from the PC to the control box. This was done to Keep the RF, (if any) flowing on the Sheild of the audio line, and cause the audio energy to flow ONLY on the two balanced wires and not the sheild. At the PC end ONLY the sheild is common with the Audio - line on the PRIMARY side of the transformer. I put a POT in the Primary side of this circuit to adjust transmit levels.

There are several paths, includding the PTT line and both of the audio sheilds that connect the pc case to the radio case.

I have the PC and the radio plugged into the same power outlet. The radio Power supply internally connects the DC minus to the Power line Ground, and the radio internally connects the DC - to the radio case ground. These are two items I can't change, so I made sure the rest of the grounding followed along.

I do have one annoying Ground Loop on one band, but it is Caused by a separate piece of equipment that is not used when On psk or SSTV so I just unplug that piece of equipment when on 20 meters.

My set up has yielded a (G3PLX) "signal cleanliness" value in excess of 30 db, so I feel it has been effective. I use this for my SSTV and My PSK31.

GIVEN
The Computer case has 3 wire ground, AND DC power supply connects radio case to 3 wire ground via DC- The radio case and the PC case are connected via the 110 volt line third wire.

Things I can control.
All wires between my Radio and My pc and my switch box, have outer sheilds that are connected to the cases on their respective ends.

I used a BALANCED audio line from PC to Transformer (INCLUDING a capacitor to block the 5 v dc voltage that IS on the TIP of the MY sound card Mic Input). The transformer Primary is connected through a POT to the BALANCED wires only. This way AUDIO energy flows INSIDE the sheild, even though the sheild and one of the balanced lines are common at the PC.

On the PC side I ran the Balanced lines from the transformer to the Mic + and MIC-. The Shield is connected to case ground on both sides.

On recieve, I simply used a Capacitor in the audio line to block the RADIO's DC Mic bias from the sound card input.

Hello Rick, I have seen some articles and plans for operating desks in older ARRL Hints and Kinks. They were somewhat simple, but were pretty efficient appearing. I have a table made like a bench of 2 X 4's, and 5/8" plywood. On that I have two old Motorola consoles that were surplus from the Police Dept, and Sheriff's Dept. bought at auction. I have removed the original internal gear, made panel's for them, and installed my own gear. These consoles are about 4' long, 20" deep, and 10" tall. They house my solid state Ham / CB gear, as well as my tube type Ham/CB gear. Hope this helps a bit.

"NPO" or "C0G" type ceramics should be fine. Those are simply the "old" and "new" designations for essentially the same thing. They should be commonly available in the values you'll need for the bandpass filter...I use them up to 4.7nF as surface mount parts and they are available in larger values than that. Regardless of whether you use ceramic or mica, be sure the leads are extremely short, especially on larger value capacitors where a tiny inductive reactance can significantly alter the overall reactance seen by the circuit it's connected to.

Cheers,
Tom

You are correct of course that the small antennas have a very low radiation resistance, so low that even a fraction of an Ohm makes a substantial difference. That of itself shows how poor an antenna it is, that pretty much all of the impedance is loss rather than radiation.

Perhaps some sort of transformer would work, increasing the impedance from an Ohm or so to 50 Ohms, a simple 7:1 ratio should do that. If the frequency is low enough an audio transformer could work, or something similar with a core appropriate for the frequency.

Why is your message dated one month from now? My screen shows January 2000 for the time stamp.

Hi John,

I am curious why you choose to use the TIP of the Mic connector for the sound card (where there is DC) and not the middle ring for the audio input. If you connect the middle ring and the outer ring of a stereo jack to the Mic+ and Mic- lines (via audio isolation transformer), you won't need to use a DC blocking cap.

I am also curious what is the capacitance of the DC blocking capacitor that you use?? (10 MF??). The value obviously works well for you.

Yes, I have heard that using balanced lines inside a shielded cable may help with RFI. It is a really good idea to use this type of shielded cable! But I doubt it will solve a ground loop problem!

It is NOT a very good idea to ground the shields of all the cables from the PC to the switching box AND to ground the shields of ALL the cables from the radio to the switching box. You WILL NOT break up the GROUND LOOPS this way even if you use balanced lines inside a shielded cable.

The purpose of the audio isolation transformers is to break up the ground loops on the audio lines. Yes there will always be a ground connection via the AC lines but that it is okay. The ground loop interference is NOT caused by the indirect ground connection via the AC line. It is caused by the generally SHORTER ground path from your PC to your Radio via the audio and PTT lines.

If all the shields of ALL the cables connected to the switching box are grounded to the switching box, you will provide a SHORT ground path from the radio to the PC (via the switching box). In other words, you will NOT have broken up the ground loop. You have defeated the purpose of using the audio isolation transformers in the first place!

It sounds like your audio is great nonetheless. But I suspect that you would also have great audio if you DID NOT EVEN USE the audio isolation transformers. Many Hams have great audio without any ground loop problems WITHOUT using audio isolation transformers and opto coupler PTT circuits. They are lucky.

I suggest that you disconnect the shields of ALL the cables coming EITHER from the PC OR the radio to the switching box. This will at least break up the ground loops on the audio lines. (These shields disconnected at the switching box will be grounded at the PC or Radio but the ground loop will be broken at the switching box).

Try it. You may find it cures your ground loop problem on 20 meters.

Don't get me wrong. The use of the shielded cables (with balanced lines inside) is a great idea to help prevent RFI problems! But if you have a REAL ground loop problem, in my view, it is not a great idea to provide a DIRECT SHORT ground path from the PC to the radio via the shields of these cables connected to the switching box.

Why would you want to use the mic input anyway? My experience has
been that that input distorts any signal of interest except
when connected to a microphone; from memory it usually contains
internal preamps. I always use the line-in instead (and even my laptop
has one).

I want to build a walkie talkie type thing but dont have the slightest clue on how to make one if it can be made. I took apart old radios, phones, and stuff like that for parts that may be needed. I dont need something too high tech just something that has a larger range than my brothers cheap set. Are there any info sources for stuff like this? Having channels would be nice too although not that important. Thanks

Hi Hamish,

Yes the preferred route is the line input jack of your sound card. But sometimes the Line Input doesn't work well (e.g. defective computer etc). Instead of paying for an expensive computer repair, the easiest solution is to use the mic input jack of your sound card.

But as you pointed out many mic input jacks have preamplifiers which can distort the signal. Fortunately, many sound card mixer programs (or other programs on your Windows Control Panel) have the option to TURN OFF the mic preamplifier which I highly recommend!

Many thanks for raising the mic preamplifier issue!

Top of page 6 of this link will give you the design. I added a capacitor at outputs but is not strictly needed. You can use the 5 volt center ring of the SoundBlaster to give the voltage to the third wire of a electret mic element if that is the type you are using. Radio Shack has a $2.00 electret mic element that is not to bad for this. I used a 10,000 ohm pot. to adjust the gain but you can vary that if you have something else laying around. I will e-mail you direct a .jpeg of a finished hand wired board. You need at least 12 Volts to supply to the chip itself on pins 4 and 7. Usually you can pull that from a serial port if you want it on the same cable from the computer but I used 2 9 volt batteries. Pins 5 and 6 go to the SoundBlaster card. Pins 2 and 3 go to the mic. Pins 1 and 8 have a 10,000K resister. My application was to get as much gain as possible and it works well. A single chirp from a little Nuthatch bird will overpower the input at 15 feet at full gain.

see http://www.analog.com/pdf/1782_c.pdf this is a large pdf file.

Looking for one or more examples of 861 transmitting tubes.
This is for a restoration project of the USS Slater, now docked
as a museum at Albany NY. This WWII vintage ship is being made
operational (!!) by some nutcase volunteers who are also restoring
the radio room and the transmitters and antennas.

This can be a charitable donation.

If you have a similar tube that might fit into the same slot
like a TL-750 or TL 1000 (as a retrofit) that might be of
interest too...

Please contact me via email.

Thanks in advance!

We (I) have assumed responsibility for a homebrew GE Master II repeater
that has a Kendecom MR-4 reciever.. We are having problems with the
squelch circuit which controls the COS .. It goes through a SPDT relat
with a diade bleeder to ground ..

DOES ANYONE HAVE A SPEC AND CIRCUIT DIAGRAM PLEASE

no, most sound cards are mono on the mic input. The center ring is either
not connected or is 5 volts for those with electret mics.

For Sale:

Item 1. Siemens (Infineon) SFA 487-2 IR LED, 3 mm package 880 nm, half angle +/- 20 degrees, 25 mw radiant power. 100 ma forward current. see infineon web site for more details. 200 for 10 dollars post paid conus

Item 2. Siemens (Infineon) SFH-2 IR LED, 5 mm, 880 nm, half angle +/- 20 degrees, 25 mw radiant power, 100 ma forward current. See Infineon web site for mor data
200 for 10 dollars post paid conus

Item 3. Siemens (Infineon) SFH 309-2/3 NPN Silicon Phototransistor, 380-1180 nm, 3 mm plastic package, +/- 12 degrees

100 for 10 dollars post paid conus

Item 4. Siemens (Infineon) SFH 300FA, NPN Silicon Phototransistor, 5mm plastic package, 880 nm (dark case) +/- 25 degrees

100 for 10 dollars post paid conus

Siemens (Infineon) multi-led LYG 3350-FO, dual color, yellow/green, 3mm frosty diffused case, two wire unit, apply voltage in one direction for yellow and reverse polarity and get green.

200 for 10 dollars post paid conus or 1000 for 40 dollars post paid conus

All units described are new and current production. See Infineon web site for detailed data.

Tnx for the read

>Cool, wow. But Robert, how does it work ? It seems almost too simple.
>
Imagine 8 sets of Xmas lights, in sets of 4. Each group of 4
are connected in parallel, and then (by use of a special pair
of series wired plugs) the two groups are in series. Now, when
a blinker bulb in the first group switches off, current can only
flow thru 3 light strings in the first group, but the same
current flows thru all 4 strings of the second group. This will
make the lights that are still on in the first group glow brighter,
and all teh lights in the second group will glow dimmer. Add
more light strings (with blinkers) to both groups, and the
amount of blinkers switching off will become random. And that
makes the various different light strings glow with different and
random levels of brightness.

5116. Component source ?

Newsgroup: rec.radio.amateur.homebrew

Two questions for all the constructors out there.

I'm trying to find a manufacturer or failing that a supplier of some inexpensive inductive coupled ammeters and volt meters similar to what are used on the Skywalker amp kits.

They are somewhat cheap and nasty looking but do the job and retail for around 10 bucks a piece?

Also, can anyone tell me which manufacturers produce TO-220 package power resistors in a 30 or 40 watt rating?

If I can find the producers I can then trace a UK distributor or import direct.

Any help greatly appreciated.

Merry Christmas everyone.

Excellent advice. I was not aware that you could usually turn these off.
In W98, I can see an advanced option called "Microphone Gain Control"
(on or off) which might be it.

5124. ISO RF Medium Power *Production* Transistors

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-24 00:00:00 UTC
From: wb4lnm@aol.com
Message-ID: <19991223200243.25280.00001200@ng-cq1.aol.com>
Source record: 64684

Our club has been working on a low (2 Watt) 222 MHz FM transceiver project. The power device that we had designed in to the unit was a Motorola MRF555 plastic device, which has now been discontinued by Motorola Semiconductor Products along with the great majority of their RF power device line. We are having to redesign that part of the PWB because of Motorola's decision.

We do not want to release the project with obsolete devices, and are looking for a replacement device. Obviously, it would be nice to have it not single-sourced, but that might be asking too much in this day and age of proprietary RF parts. Cost is a great concern - the MRF555 was about $5 in our quantities, and any SOE ceramic part, stud mount or otherwise, is too expensive.

Under investigation right now are a couple of Mitsubishi parts in the TO-39 can with case / emitter grounded. They appear to be duplicates of the MRF237 and MRF629 (which have also been discontinued by Motorola), and are available from RF Parts for $4 - 6. There appear to be NTE equivalents of these, so some "second sourcing" may be possible.

We need something that will put out about 2 watts to the antenna minus T/R relay and LPF filter losses, which are minimal, but do need to be accounted for.

Any assistance in identifying *production* (NOT SURPLUS) parts and suppliers for this application would be appreciated. If you will post the information here in response to this message, then maybe additional homebrewers will be able to benefit also. Thanks and 73.

John...

Just remember, for opamps, such as the 2017, you'll need
at least +/- 15 vdc, preferably +/- 20 vdc for better headroom.

> microphones over to amateur use?

Yes.

> I have both a G.E. mobile mic and a G.E. (made by Shure) desk mic,
> that both have unshielded wire (strange)

On the contrary. These microphones are obviously intended for use with FM transmitters. RF feedback is seldom an issue with an FM transmitter. Even the most horrific installations are unlikely to cause squealing and howling on FM. The easiest way to confirm is to see if the hanger/nubby on the back of the microphone has a wire attached to it. This is for tone squelch which I've never seen used on any other service.

> and the mobile G.E. has some
> sort of single stage pre-amp.... Or maybe it is the power supply for a
> condenser mic? Not sure.

Not a GE expert, but it is quite likely a pre-amp of some description. It could be a circuit that injects a DC bias from another one of the microphone leads though.

> Can anyone advise?

FM microphones are either dynamic or condenser (duh!). The dynamic units are either unpowered or have a built-in preamplifier. This preamplifier is almost always powered from the microphone line. If they are condenser they will also require a + bias on the microphone line. However, many radios also have a V output pin that could be used to generate the bias in the microphone. The voltage could be between 6V and 13.8V - it all depends upon the unit. A typical ham radio uses a condenser microphone also with bias on the microphone line so using the GE microphone on it shouldn't be too large of an engineering exersize. Of course, you may want to replace that un shielded cable!

5137. HP 8640 OPT. 002

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-25 00:00:00 UTC
From: Peter Bolch <nc-bolchpe@netcologne.de>
Message-ID: <8424ok$6k5$1@news.netcologne.de>
Source record: 64605

Hi,

I have bought a used HP 8640A signal generator and have fitted the 512 - 1024 MHz Option 002 afterwards. Unfourtenately I got no installation instruction with the option 002 but only a few hints. Checking the generator's frequency response with a calibrated R&S URV 3 RF mV-meter I found that the generator's output voltage decreases with increasing frequency (beginning at 30 MHz). The maximum deviation is - 3 dB in the 512 - 1024 MHz range. Adjusting the + 13 dBm pot (on the A26 board) doesn't show any effect.

Does anyone here have the installation and calibration instructions for the OPT. 002 or the schematic of the circuit around the option?

Peter

5138. Ten-Tec 1253 Regen Kit?

Newsgroup: rec.radio.amateur.homebrew

While not an *honest* homebrew issue, I am intrigued buy both the price and what the ads say you get for that $59. The receiver kit I am talking about is the Model 1253 Regen 9-band SW Receiver Kit. Anyone around here built or listened much to one of these? How does it perform receiving the major SWBC signals? Basically, I am just looking for "official" permission to buy another toy, hi. Yeah, I know already it aint no R8-B or even SW-3, but what it *is*, as the spider asked the fly?

Do the sound card mike preamplifiers distort the signal even if you don't overdrive them or are you saying it's best not to use them because they are easy to overdrive? If the sound card design is that poor, doesn't it call into question the remainder of it's audio chain? On one setup I have a very low audio output and use the mike input. I've not noticed any problem but of course that's a sample of only one sound card and others could perform quite differently.

5141. Motorola GM300 @ 9600 baud ??

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-25 00:00:00 UTC
From: "colinlowe@jet" <colinlowe@jet.es>

I have a Motorola GM300 and would like to use it on 9600 packet radio.

Here is the mod that I found on the internet......

The Maxtrac/Radius Series are 9600 baud packet capable. They do need a minor modification though. For RX, its no big deal, just take RX audio from PIN 11 of the Accessory Connector and swing JU551 to the (A) position (Flat RX Unmuted). For TX audio, you will have to run a jumper to the junction of R223,C228,R222 on the RF board to inject the data (if applicable you may need to set the deiation pot in the radio to maximum). You might want to put a pot on your TX line somewhat like the setup Motorola uses (voltage divider) to adjust the deviation. It would be wise to do some measurements to make sure you have the deviation correct. You might also want run the RX and TX pins to the unused pins on the front mic connector after the mods are done.

OK I have opened up the radio and found Jumper JU551 and moved it to the new "A" position.

I now need to find the junction of R223,C228,R222 on the RF board to inject the TX data.

Please can you let me know were the juncion of R223,C228,R222 is. The PCB is not marked and I don't have a diagram for the radio.....Can you help please.

5146. What do these parts do?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-26 00:00:00 UTC
From: Paul <paulposluszny@hotmail.com>
Message-ID: <7Ef94.5682$Ke.2734@news21.bellglobal.com>
Source record: 64614

I have no knowledge in radio or any other electronics, although I am intersted by this sort of stuff. I have a couple of questions to ask those that are willing to give some time to help me out. I want to know what the following parts in a radio do and what they are.
1) A long magnetic bar with copper wire wrapped many times around it. The bar is cylinrical in shape.
2) A cube shaped part that is transparent and inside are many thin disks pilled on top of each other. The box has four screw on the top and is made by mitsumi. The disks on the inside move in a circular fashion and dont turn all the way around. The box is about 3/4 of an inch cubed.
3) Many small cylindrical parts that are blue in colour. Most are about 1 cm in height with a width of maybe 1/4 of a cm. There is one large one about an inch high and 1/2 wide, as well as one that is in between these two sizes. All of them say L85 degreesC and have a plus sign on the top (the larger ones)
4) small staple like parts, some of which have small beige bars things on them with bands of various colous. two of them have black cylinders on them. They are the size of well, staples.
5)rectangular parts that stand up at about one centimeter and have a width and length of about half a centimter. They have round holes at the top with what looks to be a flat head screwdriver slot on the top.
6) A part with two small wires coming from a brown circular object at the top. There are many different sizes. Most are brown a few are green, there are two green ones that look like chicklets and black ones that look like 3/4 of a circle on the top. The look like circles with legs.
7) Long black parts with many "legs" coming from the side. They are rectangular and vary in size, but in general they look to be about 3/4 of an inch long and 1/4 inch wide. They look like centipedes if you look at the top and use your imagination.

I know that is alot to ask but when you are just learning you have to start somewhere. I have been looking inside electrical things since I was about 6 and now that I am at the age, I may take some courses in college. Thanks to those who help and I hope I was descriptive enough.

Paul,

This is fun - a pop quiz on the innards of a transistor radio. OK, here's my entry:

1. A loopstick antenna.
2. A variable capacitor.
3. Electrolytic capacitors
4. Resistors
5. RF/IF transformers & coils
6. Miscellaneous capacitors
7. Integrated circuits

Do I win? :-) OK, as to what they do and how they work, a detailed and complete explanation would take way too long for me to write up and post, but I'll do a quickie. Once you've read it, go to your nearest Radio Shack and poke through the "Engineer's Mini-Notebook" series (by Forrest M. Mims III). Find the most basic one you can (I recommend the one called "Basic Semiconductor Circuits" - catalogue number 62-5013 - it starts out with explanations of what resistors and capacitors are and how to use them and goes on to describe semiconductors and some basic circuits). Read through the book for a day or two (it's only 48 pages) and then go back to the Shack and buy some parts and tools and build a few of the circuits. When you're comfortable with what's going on and want to know more and get impatient with the simple books, get a copy of the "ARRL Handbook for Radio Amateurs" (check out the ARRL website). It goes into a lot more detailed information and is a good basis for a non-formal study of electronics, especially RF communications.

OK, here's the instant gratification part:

1. The loopstick antenna picks up the radio waves that are all around you and feeds them to the receiver. The ferrite bar and many-turn wire loop make an antenna that is much more compact, and therefore more portable, than the typical dipole antenna that a fixed station would use.

2. A variable capacitor is used to tune the input of the receiver. The frequency that the radio listens on is usually inversely proportional to the square root of the tuning capacitor value. That is, doubling the capacitance make the received frequency cut in half. The metal plates are the parts of the capacitor that hold the charge and the layers of polyethelene are the insulating dielectric. As you turn the plates relative to each other, the amount of charge they hold changes, changing the capacitance of the unit.

3. Electrolytic capacitors also hold charge, but much greater amounts than the variable capacitor. They are typically used to filter noise from power

supplies and to make low frequency (audio) circuits.

4. Resistors can be thought of as current and voltage restrictors. They are used to put specific values of current and/or voltage into specific points of a circuit.

5. Read the handbook section on inductance and AC circuits and superheterodyne receivers. Just be aware that turning the screws can cause your radio to tune all over different parts of the band

6. Like #3, except probably less capacitance so higher frequencies (IF & RF). They're also used to tune AC circuits.

7. These devices contain anywhere from several to several million transistors in one package, depending on the device. They're also known as chips because they contain a chip of doped silicon that actually holds the transistors and other components. In the old days, amplifiers and other circuits would be built of individual tubes or transistors and took up lots of room with lots of complex (error-prone) wire connections between the parts. Now, all the active parts are on the chip and all you have to do is to add a few capacitors, resistors and coils to have a working circuit. They're physically smaller, use less power and have fewer connections. In your radio these chips may implement amplifiers, oscillators, demodulators, etc.

Now that you have this, go get the books and do your homework. The most important thing you can do right now is to read, read and read. And as a break from reading, build a few circuits (simple ones) to try out what you've learned. At your stage, no circuit is too simple. A battery and a resistor make a good start. Use a voltmeter to measure the voltages at various parts of the circuit, and ammeter to measure the currents. Wire resistors in series and/or parallel, etc. And if you're feeling more ambitious, buy one of the simple kits and build your own crystal set. Then add a transistor or integrated circuit amplifier. Have fun,

73 de KF4PV/3, Laszlo

That's a ferrite antenna. It's a coil that captures AM radio waves.

> 2) A cube shaped part that is transparent and inside are many thin disks
> pilled on top of each other. The box has four screw on the top and is made
> by mitsumi. The disks on the inside move in a circular fashion and dont
> turn all the way around. The box is about 3/4 of an inch cubed.

It's a variable capacitor. Together with a coil, it allows you to select
the frequency of the station you want to hear.

> 3) Many small cylindrical parts that are blue in colour. Most are about 1
> cm in height with a width of maybe 1/4 of a cm. There is one large one
> about an inch high and 1/2 wide, as well as one that is in between these two

> larger ones)

These are electrolytic capacitors. They are used to block direct current
(DC) electricity, used to power the circuits, and let the alternating
current (AC) part, which carries the signal you want to hear, pass
through.

> 4) small staple like parts, some of which have small beige bars things on
> them with bands of various colous. two of them have black cylinders on
> them. They are the size of well, staples.

These are resistors. They allow one to regulate the current that passes
through a given circuit. The current is given by Ohm's formula: I = E /
R, where I is the current in amperes, E is the voltage in volts, and R
is the reistance in ohms. The colored bands are a code that tells the
resistance.

> 5)rectangular parts that stand up at about one centimeter and have a width
> and length of about half a centimter. They have round holes at the top with
> what looks to be a flat head screwdriver slot on the top.

Shielded coils. Work based on the same principle as the ferrite antenna,
but have this metal shielding because they should not receive the radio
signals, but just select some frequencies inside the circuits. The slot

is used for adjusting the frequency, by inserting a ferrite nucleus more
or less in the coil.

> 6) A part with two small wires coming from a brown circular object at the
> top. There are many different sizes. Most are brown a few are green, there
> are two green ones that look like chicklets and black ones that look like
> 3/4 of a circle on the top. The look like circles with legs.

They are probably capacitors. They have the same use as the electrolytic
capacitors mentioned above, but a somewhat different internal
composition.

Those 3/4 circle black ones, if they have three legs, they are
transistors. A small variation of current in the "base" wire will cause
a much larger variation (about 100x bigger) in the "collector" wire. The
third wire is the "emitter", used as the return wire for both input and
output circuits. This "common emmiter" circuit is the most usual
configuration in AM radios, both "common base" and "common collector"
combinations are also possible and used in other types of circuits.

> 7) Long black parts with many "legs" coming from the side. They are

>

Integrated circuits, IC's for short, also known as "chips". They contain
complete circuits in them, containing transistors, resistors, and
capacitors etched in a silicon crystal.

> I know that is alot to ask but when you are just learning you have to start
> somewhere. I have been looking inside electrical things since I was about 6
> and now that I am at the age, I may take some courses in college. Thanks to

Chicken mesh can be a satisfactory screen provided that teh wavelength
of interest is much larger (five to 10 times) than the mesh size and
that the joints remain conductive.

For shorter wavelengths and where joint corrosion might pose a problem
one can use hardware cloth. In the US it comes in 0.5 inch, .25 inch
and .125 inch sizes. The joints are condcuting by virtue of the
hot-dip galvanize coating. It is more expensive than chicken mesh, but
still relatively easy to use.

I am wanting to build a new 2 meter repeater and looking for advice on a good receiver and transmitter to use. I presently am using a GE master pro. Put that repeater on about 17 years ago. Looking for something a little more modern and better receiver for selectivity, sensitivity, and intermod rejection. Any sources for equipment and suggetions would be appreciated. Does anyone know the address for Maggorie Electronic Labs? I was told they sell receivers, transmitters in addition to entire ham repeaters.
Thanks, Tom WA5KUB please email at tcmedlin@cris.com

Nick,

Check the following web page for photos of amps: http://207.108.137.61

There are at least two there using 4-1000A's, on a single tube and one a
dual tube. Check with the photo submitters.

I am trying to locate:

1. A manual for the 8200 .. for programming
2. CTCSS board for 8200 and installation instructions

BUT I would like to correspond with someone who has one and can "email"
me thru a couple of things
thanks,

Come on, folks! This is a either a bad troll or a lazy dolt
that hasn't bothered to vist a library in 10-11-12 years to
attempt to learn a little about what he is 'interested' in.

In either case, we've wasted far too much bandwidth on THIS thread.

From: Matt Krick <dcflux@yahoo.com>
Message-ID: <3866876F.3E524B1F@yahoo.com>
Source record: 64628

Wanted:

TLR-313
7 segment LED display used in Tempo VHF-1 radio, Common anode, 10 pin dip arangment. What I know is Pin 5 and 10 are common anode, 7 is decimal point. I need at least 3 of them but more would be better, The unit is no longer made by toshiba and all the replacement numbers I have

found are not the same pin pattern.

Actually if anyone has a VHF-1 that doesnt work, the board that the modules are on would be nice.

Please contact me if you have said modules.
Thanks.

At my mom's house in Oradell NJ, I have a bunch of microwave waveguides and similar stuff. Such as attenuators, things with slots, etc. I'm not familiar with microwave, but this stuff appears to be 50's vintage.

All FREE, but you eighter pick it up at my mom's house (email for directions and appointment) or you pay shipping.

5162. Elmers Directory Needs Elmers!

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-26 00:00:00 UTC
From: pschleck@novia.net
Message-ID: <SWw94.12300$K7.468642@newscene.newscene.com>
Source record: 64630
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew

-----BEGIN PGP SIGNED MESSAGE-----

As readers of the rec.radio.amateur.* newsgroups are probably aware, I maintain a periodic information posting and WWW Page known as the Amateur Radio Elmers Resource Directory (aka the "Elmers List") which provides a list of Internet Elmers, indexed by topic, and their E-mail addresses. (For users of threaded newsreaders, this article is linked to the base article of the directory itself). You may also access the Directory at:

http://www.novia.net/~pschleck/elmers/

In order to maintain its value to the net, I have strived to keep it accurate and up-to-date. In addition to reviewing the currency of the entire Directory every 2 years, I am constantly scouring the newsgroups for new Elmers to join the directory. Areas of expertise that are most desirable for the directory right now include:

- Any expertise from residents of states, provinces, and foreign countries not currently represented
- Advanced homebrewing techniques (surface-mount, VLSI, DSP, spread-spectrum, etc.)
- TCP/IP Packet Radio and Gateways/Internetworking (particularly local IP coordinators and/or subnet managers/operators/leaders)
- Amateur Satellites/Space Operation (particularly Microsats, SAREX, and ARISS)
- Amateur-related Software for Unix/PC/Mac/Amiga/Psion/HP-95/PalmPilot
- College Clubs and organizational guidance/strategies
- Boy Scout Amateur Radio Merit Badge Counselors
- Unix/Linux/X-Windows programming and configuration
- Amateur Radio Organizational Contacts (I am especially looking for contacts for the ARRL Field Organization, GRAPES, AMSAT, QCWA, QRP Int., NARA(?), QRZ, CSVHFS, LAMBDA, ARES, RACES, FEMA, NACEC, any state OES or EMA, as well as any regional frequency coordinating body)
- Band, Mode or, Brand-specific equipment (actual manufacturer or dealer contacts would be quite welcome, as long as they reveal their affiliation and at least provide *some* free services)
- Maintainers of unique amateur-radio-related anonymous File Transfer Protocol (FTP) sites and World-Wide Web (WWW) Home Pages (as opposed to those that are substantially a rehash of, or pointers to, existing sites).
- Maintainers of unique amateur-radio-related mailing lists
- Editors/contacts for amateur-radio-related publications

In particular, based on reduction and analysis of 7 months worth of audit logs from the geographic-area/subject search engine on the main Elmers Directory home page, the following geographic-area/subject pairs were requested two times or more, but resulted in no match in the directory (meaning that the individuals seeking assistance could not find a matching Elmer):

If your geographic area and subjects of expertise appear in either list above, your help as an Internet Elmer is greatly needed (particularly for those subject areas followed by numbers greater than 10).

I'd like to emphasize that participation is totally voluntary, with very minimal obligations (1 or 2 polite inquiries a month, if feedback from existing Elmers is any indication). If you find that it is too much work, you are welcome to bow out, no questions asked. You don't even need access to Network News or the World-Wide Web, just a reliable E-mail address.

If you'd like to volunteer, please go to the following Web-based registration form:

http://www.novia.net/~pschleck/elmers/register.html

If you do not have access to the World-Wide Web, send a short E-mail message describing yourself and your areas of expertise to elmers-request@novia.net (the default Reply-To: of this article).

Thank you to everyone who answered my questions and to those that think I am a troll, I hope you get electricuted when you take part in your hobby. Wow, I had no clue there could be such rotten apples that cant even lend a hand to those in need. Im sorry if I am not as educated as you in this field but I wont let one a$$hole discourage me. About your library reply Jonesy, in this day of computers and the internet I thought that the internet was a good tool to exchange and receive information, but I guess to you it is only for entertainment. Just remember the library isnt the only place for information and if I can get answers at home, than I will do that. One last thing, dont take this so seriously, why respond if you think I am a troll? How many times have I posted here before? This is the second time and probably one of the last because of one d*ck head. Once again thanks to those who responded and I hope I can use this info one day soon.

From: "Al Lorona, Jr." <al_lorona@agilent.com>
Message-ID: <3866A938.F0E@agilent.com>
Source record: 64632

Hi, Will,

I built the 1253 a few years ago and fire it up occasionally to listen to AM SW. It's a real blast to use.

Its performance is outstanding in the areas of sensitivity and audio quality. Oooooh man, that AM audio is probably the best I have heard in any receiver, regardless of price. Clean, loud, and practically hi-fi.

Have you ever used a regen? The 1253 ranks as average or above average in ease of tuning. Especially on strong SSB and CW signals, it can get a bit squirrelly as the oscillator gets pulled off frequency.

I live within two miles of a 20 kW AM MW station and had to add a trap at the antenna input to keep it from overloading the receiver.

It's worth the money. Good luck building and listening to it.

R,

Al W6LX

please search this site for the chip
LA1265. This is a single chip AM/FM radio chip
like LM373 (which is AM only.)

This chip is used in grundig YB400, SONY ICF2001
almost all BOOM BOXES and STEREO receivers.

(Scrap boom boxes usually yield this cip and a number of useful
455 and 10.7 mhz coils plus the power transformer!)

(The digital stereo receivers have also the SYNTH chip
LC7128 etc which can be used/abused for HF work.)

> is okay.

The way I read the FCC rules, certification isn't required if you
home-brew a Part 15 transmitter from scratch, but kits must meet the
same requirements as assembled devices.

Excerpts from the FCC Part 15 rules:

"Home-built devices.

(a) Equipment authorization is not required for devices that are not
marketed, are not constructed from a kit, and are built in quantities of
five or less for personal use.
(b) It is recognized that the individual builder of home-built
equipment may not possess the means to perform the measurements for
determining compliance with the regulations. In this case, the builder
is expected to employ good engineering practices to meet the specified
technical standards to the greatest extent practicable. The provisions
of Sec. 15.5 apply to this equipment."

A kit is defined as "Any number of electronic parts, usually provided
with a
schematic diagram or printed circuit board, which, when assembled in
accordance with instructions, results in a device subject to the
regulations in this part, even if additional parts of any type are
required to complete assembly."

What kind of illegal transmitters does Radio Shack sell? I don't see any in my catalog. Some of the Ramsey kits do not meet federal requirements and they do get used by people who do not know they are illegal - sometimes in commercial applications.

5173. MIC pinouts for Heathkit HW-101

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-27 00:00:00 UTC
From: Curtis Scholl <cscholl@izzy.net>
Message-ID: <38681773.8BB4B772@izzy.net>
Source record: 64640
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Hello Group!

Does anyone out there have an ascii representation they are dying to
show someone on the pin outs of the Heathkit HW-101 MIC connector?
I bought a Yaesu Hi Impedance mic (50K ohms) but it uses a stereo Tip
Ring Sleeve rather than a 4 pin DIN. I could short a couple of the pins
together to determine the PTT switching, but I would not like to harm
anything important.
I have a manual on order, but would like to get started....antsy.

The HW-101 used a simple connector for the microphone. If yours has a DIN connector, someone changed it.

Ground each pin in turn to see if it keys the transmitter. That's the PTT line. The other is the audio.

==========
Suspect "old" electrolytic capacitors (even if never used) should be
reformed = revitalised and checked by repetitive re-charging them up
to the max working voltage via a high value resistor in the megohms
range, followed by de-charging via a lower value resistor . The
higher the charging resistor the slower and more effective the
reforming process ....take the time !

Message-ID: <rIV94.16535$Ym1.691423@tw11.nn.bcandid.com>
Source record: 64544

Hi all, thank you for reading,

I built an rf amplifier using a single 4X150A, and used a conventional PI output network, with one unusual feature. The inductor is a roller type with a max of 10uh. Tuning cap is 7-70pf and loading is 40-400p. The inductor is set to short the 'unused' section. Why is this done? Also, I can get almost no output at 18,19 and 26 mhz. Got plate current, and grid drive, but little output. Lots of input, almost no output, and most amazingly, 'no smoke'. What is going on??

Message-ID: <84a6ogeqc1@news1.exit109.com>
Source record: 64545

hi,

I built the 1253 regen 3 yrs back.
1. its regen/reaction control is not smooth.
2.It is susceptible to audio oscillations.
3.much better performance ca be obtained even from fet transistor circuits
Ibuilt one using a fet at 1.5 volts, and this was veryvery good.

I would honestly recommened that you build one using tubes
like 12sn7/12au7/6u8 at low voltages (12-50) volts on plate.
Even the the12sn7 @24 volts on plate beats even a superhet
rx and has very smooth regen.

Use a throttle cap for regen and please use a 12-012 volt/,45 amp
transformer primary as the choke load for detector.

Ican post ckt if you need it.

Having the unused portion of the tank inductor shorted sounds like the problem to me. A shorted turn will drastically lower the Q - and obviously it gets worse as you go lower in intended inductance, hence having more shorted turns coupled. All the variable inductance resonators I've ever seen or used simply left the unused portion floating. (Output tank circuits, antenna loading coils, etc.)

5180. Re: rf power amp tank question

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-28 00:00:00 UTC
From: Bob <balbert@cnmnetwork.com>
Message-ID: <pP5a4.156307$y45.3243789@news4.giganews.com>
Source record: 64547

The jury is still out on whether to short unused turns or not. Here is the situation:

If you leave the unused turns open, transformer action will cause a build up of potential and possibly cause arcing.

If you short the unused turns, circulating currents could cause waste of power.

Many designs have the first few turns of the inductance of heavier wire so that the losses will be less. One test would be to run the amplifier for a little while with key down then shut it off and touch the inductor to see if it's hot. With that much power seeming to be lost, it certainly should be warm or even hot to the touch.

Loss of power is common at the higher frequencies. Lead dress is often the culprit, with stray capacitance and inductance bleeding off valuable power. The leads must be kept short, components small, and kept well away from other components. I had an HF amplifier that had no output on 10 meters and after I shortened up things a bit it began to give useful power on that band. It was better on 12 meters and full output on 15 meters.

Another approach might be to make a separate 10 meter inductor in series with the roller inductor, and at right angles to it. Then the roller would be nearly totally out of the circuit when on 10 meters and it would be safe to have it open rather than shorted. The 10 meter inductor could be of tubing or other large diameter high Q material. It won't have much effect on the other bands.

I am looking for several receiver type variable capacitors with
following maximum capacitances: (1) 300 to 400 pf single section, (1)
20-40 pf single section (1) 50-150 single section (1) 30-75 pf single
section and (2) multiple section matching 200-400 pf per section. Last
one can be a single cap with 4+ sections. All should be 1/4" shaft for
panel mounting and fairly compact. Please e-mail.

Thanks,

Andy

I'd like to build the 10GHz wideband FM project exactly as shown at:

http://www.geocities.com/SiliconValley/Vista/7012/wideband.htm

Anyone know where I can obtain at least two of the Solfan modules
used (or any cheap gunnplexer that has been confirmed to work with
the circuits shown on this site)?

Thanks in advance for any help.

Source record: 64553

FWIW: I once measured a transmitting coil about 3 inches long, 1.5 inches diameter, air wound with 14 ga wire on an Boonton lab Q meter. With shorted turns, the Q was reduced by 9 percent over the value with no turns shorted. In other words, the Q was 91 percent of the unshorted turns value. Number of shorted turns didn't seem to make much difference. The change in inductance was insignificant.

Anyone else have measurement data?

Definitely check out http://www.shfmicro.com. They sell some very nice
M/A-COM Gunnplexers that can be upgraded to 100 mW output, at very
reasonable prices.

Also FYI, there's some more info on wideband FM/FSK microwave work at my
site below, along with further links to component and information
sources.

I'm sorry if I did not post this message in the right NG but I could not find a NG related specifically dedicated to Heathkit.

I have been looking for a weather station for a while. A ham I met recently has a Heathkit weather station that he wants to sell. He doesn't have a clue of the value of the weather station and so do I.

As far as I can tell, the only problem with his station is the bearing of the anemometer that needs replacing. Every thing else is very dusty but semms in good working order.

Could someone tell me how much this weather station is worth ? I want to offer a fair price to this man. I don't know if there is a site dedicated to Heathkit weather stations. I have not found one yet but I would really appreciate receiving URL's that are related to the above mentionned subject.

Hey Paul!

I sure hope you don't duck out because of one or two negative (or even
mean-spirited) responses. Remember, the Internet comprises a large
pool of people, with a varied cross-section of personalities, and is
bound to include some contentious souls who want to criticize you for
the sole purpose of inflating their own egos (or whatever their
purpose is). So what? Let it slide... if you ignore it, everybody
who reads their response sizes them up for what they are... but if you
respond defensively, you've empowered a small minority of fractious
people to continue in that vein, because they thrive on your reaction.

Just look at the helpful responses you got! (you didn't seem to give
nearly as much weight to those)

And by the way, this was a perfectly appropriate question for this
group... novices and newbies and curiosity seekers will always be
welcomed by the vast majority of us.

73 (best regards),
monty N5FC

Dear All,
A couple of questions:

1) OA79 device specs - what are they?.
2) Does anyone know where I can get a matched pair of OA79s or
equivalent.
3) what are the desirable characteristics for signal diodes when used as
a balanced modulator.

I am continuing to get a G2DAF TX going and I am now trying to get the
carrier removal from the SSB filter set up as best I can. I've got as
far as i can with alignment but would like to try and put better devices
in if possible to improve the modulator performance as I can still hear
a very small amount of carrier on the RA17 that I use in the shack and
there is a bit of a "ping" when the PTT is pressed.

Cheers and happy xmas, new year etc etc ect

Unfortunately, a year after you came here (did you have the RA17?),
I had a further clear-out and out went all the Mullard geranium specs,
a whole dustbin load.

However, from other sources here.....
OA79: Geranium point-contact detector, PIV45, max rev current 350 uA
(at 45 V) , max rectifier current 35 mA

For matching any semiconductor diodes, you need only measure the
reverse leakage current because all other diode characteristics
come from this......

ISTR.....

I = Idss(e^(qv/kT) -1)

5194. Fiber Optics in Ham Radio??

Hi, Paul -

Please accept my apology for the jerks that responded to you. I've yet to find a newsgroup that didn't have some.

You got some pretty good answers that may get you started. One gentleman suggested the Forrest Mims books from Radio Shack, which I agree are fine for exploring basic circuits. However, when I started out, I needed some even more basic info, and my recollection is that the Mims books don't help with *really* basic stuff. In my case, what worked was to get one of those "100-in-one Electronic Projects" type of kits. The ones I'm thinking about have an assortment of electronic components and some kind of 'breadboarding' arrangement (a way to temporarily connect them in lots of ways). The manual gives directions on making all sorts of things, like simple transmitters, amplifiers, buzzers and "shadow detectors". Start with the simple circuits and try to figure out how they work, and you'll learn fast. Feel free to email me with questions.

Who else remembers starting out with these multi-project breadboard kits? Mine was a Heathkit, and one of my fav projects was a little one-transistor oscillator that ran on the AM broadcast band and had a range of tens of feet. At 10, I thought it was absolutely the coolest thing!

Good luck, Paul.

OA79s were probably germanium devices - difficult to get now

You could try a pair of Schottky low-power switching diodes. Forward voltage is about 0.4 V compared to 0.3 for germanium, so they ought to work with the drive available in the G2DAF. Also modern manufacturing make it likely that any pair from the same manufacturer and of the same type will be pretty well matched.

Source record: 64566

I don't have specific measurement data to contribute, but what you observed seems consistent to me. The small change of inductance says the active turns and the turns you shorted or opened aren't coupled very tightly; and that goes nicely with the lack of significant Q change. In any event, the unloaded Q of the coil should be (shorted turns or no) high compared with the loaded Q of the tank, resulting in relatively little of the power lost in the coil. IF the coil Q is 300 and the loaded tank Q is 10, then only 1/30 of the total power should be dissipated in the coil.

Note that a shield around a coil is a shorted turn, and it does change the Q -- mainly by lowering the inductance of the coil.

I didn't try to analyze the tank circuit the original poster talked about, but...what is its loaded Q? And if there's plate current and grid drive...where is the power going? You know the DC input power, and that MUST end up as either heat in the amplifier or (RF) output power. Does the pi load normally into a dummy load??

Cheers,
Tom

I need ideas for a low power 1-2W AM transmitter that operates around 300Khz. A quarter wavelength
long wire antenna is possible but there is limited power available (12Volt batteries). This is for short range use of
GPS receivers that have built-in differential beacon receivers. The working area is hundreds of miles from civilization. I cannot find out anything about equipment/designs for this frequency range.

Heathkit actually put out two weather stations. One
was with 4 analog gauges that could be mounted either
horizontally or vertically and the other was a more
advanced digital display unit. The analog version sold
new for about $190. as I remember it (I have one of them).
The bearings in the anomometer were made out of teflon in
later versions of it. Where to get those, is probably an
exercise in itself. You can use the above new cost to
come up with a what it's worth to you cost. I don't
remember the cost of the digital version but I think it
was a least double. Oh, another thing to look at are the
sealed switches used for both the wind speed and direction
indicators. They tend to fail over time. You can find
replacements from a catalog from All Electronics Corportation
P.O. Box 567, Van Nuys, CA 91408-0567.

FAR circuits has an am sync pcb based on a Ham Radio mag article (for $1 they supply a copy). It uses a Motorola MC13022 device. FAR is on the WEB- don't have the URL, just do a search.

i have a crystal converter that lets me receive shortwave frequencies on my car radio. there are local mw stations getting past the front-end and causing hetrodyning when a sw station is received on that position on the am dial. does anyone have a filter circuit to eliminate mw signals but pass signals above 3mhz? the front-end i have is simply a variable cap in parallel with an inductor. its range is from 5mhz to 10mhz. it selects the frequency to be mixed with the crystal frequency, but it doesnt attenuate enough to eliminate a few powerhouse stations entirely.

thank you to all who replied to the original post.

I 'unshorted' the unused section of the tank and 18, and 19
mhz became usable. sensible loading and output power. 26mhz
did not come to life, but the amp has no practicle application
at that frequency anyway. the 28 mhz operation is 'tighter'
and more predictable with the 'shorting strap' in place, and
overall, the amp is a few percent more efficient at all freq
with the short across the unused turns.

thanks again.

It is true that very little engineering literature has been written
since the 1950's :-).

There is quite a lot of activity on the European LF amateur allocation
at 135.7 .. 137.8 kHz and the license free LOWFER operation in the US,
so a web search on lowfer or "136 kHz" should bring up quite a lot of
links including LF transmitters, antenna tuners and antennas.

I built the ten tec kit as well. Solid construction; easy to build, and it worked when built; regen control was *not* smooth. Noted some microphonics but did not find it a problem. Seemed like the pot that controlled the regen got noisy very quickly; also had some trouble getting regeneration on all the 9 bands. Didn't work too well at the high end of it's frequency range, which I guess is no surprise in a regen. Audio had plenty of volume, but it was difficult to tune in any SW BC stations so that they were listenable. Drifty, too, which also made BC listening problematic. And I followed good tight construction practices.

My review in sum would be: fun to build; fun to play with for a while, overall, performance disappointed me in the areas cited above.

There have been a series of articles (in Comm Quarterly; recent ARRL handbook; QEX(???)) by Charles Kitchens (sp?) on regen receivers he's built; I have not built any of them. There's also a book from Lindsey Books, by an OT who has written down everything he remembers about building tube regens. He has a couple of solid state schematics as well. The key seems to be, use the throttle-cap as the regen control, as the previous poster has noted.

best regards,
nick caruso

5215. FS: RF comps for builders (long)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-30 00:00:00 UTC
From: Brad Thompson <Brad_Thompson@pop.valley.net>
Message-ID: <386C101B.CFC@pop.valley.net>
Source record: 64583

Hello-- Revised 12/30/99

I'm offering homebrew builders oddball, offbeat and hard-to-find NOS RF components, including...
***
Hewlett-Packard MSA-0786 MMICs ($1.00 each, $5.00 for 6, $10.00 for 15, or $25.00 for 50 pieces); DC-2 GHz. These are taped and reeled and have leads configured for surface-mounted applications. Specs are available at HP's web site (or with your order)...
http://www.hp.com/HP-COMP/index.html
***
1N5711 Schottky diodes, full-length leads, taped and reeled, $1.00 for 10
pieces
***
1N5821 Schottky rectifiers, full-length leads, bulk packed, $1.00 for 8 pieces
***
PIN diodes, no other specs available; full-length axial-leaded packages; individually serialized in sealed-foil envelopes. $1.00 each.
***
JAN 1N748A Zener diodes: individually sealed in mil-spec foil packets for your protection<g> in 1983.
$1.00 for 6 pieces.
***
SD-201 Signetics DC-2 GHz DMOS single-gate FETs four-lead TO-72 can (like TO-18 w/shield lead). A conductive-rubber antistatic "O" ring encircles
all four leads. Specs (available on request and with purchase) include S parameter plots. $1.00 each, $3.00 for 6, $5.00 for 12 pieces.
***
TN-2219A National Semiconductor NPN general-purpose NPN transistor:
100 < hFE < 300 at Ic= 150 mA; BVcbo = 75 V min.; BVceo = 40 V min.;
Icbo = 10 nA max. at Vcb= 60 V; Cob = 8 pf max.; Ft = 60 MHz min.
at Ic = 20 mA. NF 4 dB (max.)
In TO-237 metal-tabbed plastic package (similar to TO-92); this package reduces thermal resistance from 125 C per watt for a TO-92 to 50 C per watt for the TO-237.
Ideal for building a QRP rig around a single device!
$1.00 for 20 pieces; $5.00 for 120 pieces

***
Minicircuits T1-1T (1:1 turns ratio (center-tapped)) broadband RF transformers (80 KHz to 200 MHz); leads are formed for surface mounting but you can rebend for DIP insertion. Visit www.minicircuits.com for

full specs via their catalog.
$1.00 for 3
***
Minicircuits PSCQ-2-400 90-degree, 2-way power divider, 0.9 dB insertion loss, 225-400 MHz; $1.00 each
***
Fair-Rite cores (both type 43 mix):

2643023002 (a long-cored toroid) $1.00 for 10 pieces
2843002402 (binocular (balun) core) $1.00 for 20 pieces
***
Coilcraft p/n 142-07J08 single-winding adjustable inductors.
330 nH min./ 378 nH nom. /427 nH max.; 307 nH with tuning slug removed. Q is 112 min. at 40 MHz; 7.5 turn winding on 10 mm molded form.

$1.00 for 5 pieces; $5.00 for 35 pieces.
***
RF power xfmr.: consists of two 1.125-inch long by 0.570 inch OD ferrite sleeves with tubing primaries. Two small circuit boards short one end of the tubes, and the other two are not connected. A section of Teflon (tm)-insulated wire passes through both tubes' centers twice, making a 1:2 turns ratio stepup transformer (you can easily remove this winding and replace it with more turns at a smaller gauge) At a (nonguaranteed) guess, the assembly might handle 100 watts of RF. The core specs are currently unknown.

Price: $1.25 each (scanned image available on request)

***
Pulse Engineering PE-53190 toroidal inductor for switched-mode power supplies.
Inductance = 12. 2 microhenries at zero DC; 8.7 microhenries at 2.5 A DC.

Price: $1.00 for 6
***
SAW-stabilized oscillators; intended for ECL circuits, but also reportedly usable as LOs. All are packaged in metal DIP cans.
$4.00 each, or three assorted for $10.00

Frequencies available are:
222.222 MHz (RF Monolithics HC1279; proprietary p/n marking)
350.000 MHZ (RF Monolithics HC1301)
366.667 MHz
400.000 MHz ($2.00 ea. but not NOS; removed from PC boards)
733.333 MHz
***
Teflon- and diallyl-pthalate insulated single-point turret lugs at $12.00 per 100 (many styles available-- e-mail a request for information and a jpg image showing various types).
***

Feedthrough capacitors: Spectrum Control 100 pf nominal (threaded
bushing mount, hardware included). Attenuation is specified as
-10 dB at 300 MHz, and -20 dB at 1 GHz.
$.50 each, $1.00 for 3 pieces. ***ONLY 36 PIECES REMAINING***
***
Air-variable capacitors manufactured by Cardwell (their part no.
PL6348).
NOS surplus, m'fd. sometime in the 1950s.
--Configuration: consists of two plates separated by 0.1";
--Estimated capacitance range: 1-5 pf.
The adjustment shaft is 0.25" dia. by 0.5 inches long; bushing or
isolated mounting; easily disassembled for capacitance vs. frequency
modification, etc. A more-detailed description is available on request.

Price: $3.00 each, $10.00 for 5 pieces, $20.00 for 12 pieces.
***
Caddock MS281N NONINDUCTIVE resistors:

10 ohm +/- 5 per cent tolerance, 8 watt noninductive power film
resistors
Tinned axial leads (0.75 inches long) are formed for PC-board
insertion on 1.2-inch centers. These are NOS, bulk-packed parts.
Note: these measure well within tolerance at +/- 0.2 ohms typical. Full
specs are available in PDF format on Caddock's web site
(www.caddock.com)
but highlights are:
--Temperature coefficient of resistance: 50 ppm;
--Power rating: 8 watts at 25 C, derating to 4 watts at 150 C and
0 watts at 275 C;
--Noninductive design: serpentine film layout cancels magnetic field-
equivalent inductance of a straight piece of wire of the
resistor's body plus lead length.

Applications include:
--Current sampling;
--Cathode bias;
--Dummy loads for audio and RF applications.

Price: $1.00 each ($10.00 for 12 pieces); only 70 pieces available
****
Six-lug terminal strips, like Keystone p/n 825: six isolated, tinned
steel lugs mounted on a brown phenolic insulating strip, arranged in
groups of three on either side of a central mounting bracket. There's
no center grounding lug, but you can add a jumper to an adjacent lug
or two as required. Tie-point strips work well for breadboarding if
you use unetched-copper PC board laminate as a ground plane.

The lugs are spaced on 0.375-inch centers; mounting bracket has a
0.140-inch hole (use a 6-32 screw for chassis mounting).

I've sold thousands of these, but my supply is running low. Buy a batch
now before they all go to good homes<g>. ***DEFINITELY THE LAST CALL!

ONLY A FEW HUNDRED REMAIN***

Prices: $.15 each, or $6.00 per 50 pieces, $10.00 per 100 pieces.

****
* NOS Warranty policy *

5216. Re: Winding Transformers?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-30 00:00:00 UTC
From: paul <apollo_six@btinternet.com>
Message-ID: <W8I1bBAIw8a4EwJT@btinternet.com>
Source record: 64584

Here in the UK I've found some armature and motor rewinders very helpful. I wouldn't recommend rewinding anything much above 240 volts, basically because of the boring chore it is and also the problems of interwinding insulation.

The cheapest option for EHT transformers would probably be getting a "sample" wound of a mains toroid transformer to your spec.

There is information on wire sizes to be found in the ARRL handbook. A micrometer also comes in useful to measure wire diameter too! I also believe that's there's info on the power ratings calculated on transformer core cross sectional area.

Paul

5217. hustler antenna triple mount for home use

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-12-31 00:00:00 UTC
From: William Mastop <wmastop@home.com>
Message-ID: <S16b4.121860$ri.634359@news1.rdc1.bc.home.com>
Source record: 64444

Here's a thread between Dale kc2pz and I regarding a triple mount hustler antenna, for home use, with three resonators attached to one mast. The idea has considerable appeal to me, but I wanted to run it past others on the group before embarking on the project. Any ideas would be appreciated.
William

From: dale brown <dgbrown@wcnet.net>

Mike...I have a hustler antenna and I made an adapter to mount three resonators on one mast. I cut an equilateral triangle 8 inches on a side out of 1/8" aluminum plate. I drilled a 3/8" hole in the center and on each tip about 3/4" in from the apex. I then put the tip into a vice and bent over about 1 and 1/2 inches to about 30 degrees. This worked very well with my FT-890. I bolted the hustler mount on a 2 inch square tube and stuck it in the receiver hitch. The wind load is not too bad, but to be safe (above 70 mph) I tethered it to the luggage rack on the top of the vehicle....Dale KC2PZ
Thanks for the posting Dale. Very interesting idea. I have one bit of trouble with your description as set out below. You say you put the tip in the vice, and bent it over about 1.5 inches, to 30 degrees. When you say tip, do you mean the 3 tips of the triangle, not just one? If so, does this then mean that the antennas- or the resonators and whips rather, point something other than straight up? Also, how did you affix the resonators to the plate itself? Just with a bolt through the holes on the tips of the plate or???
Any help would be appreciated. I may be able to use this at home, as I have a base mounted hustler here, and hate to change the resonators. Have you noticed any compromise of your signal with this arrangement?
I look forward to hearing from you.
William Mastop (VE7WJM) Vernon, British Columbia Canada

William.....Yes, all three tips were bent over at the 30 degree angle. The center of the triangle has a 3/8 inch hole to mount to the top of the hustler mast. I bought four 1/2 inch long bolts to attach the resonators and plate at the hardware store...I believe they were 3/8 inch in dia. with 24 threads per inch..however, you can take a resonator with you to the hardware store to match the threads. The shallow 30 degree angle does not noticeably effect the received or transmitted signal. The relative positions of the three resonators and whips minimize interaction.....Dale KC2PZ

I am posting this for a friend of mine, Paul, W8ZH. Please respond to him directly at w8zh@juno.com

73, George
K8BRW

I am looking for a Henry 8K. I have for sale or trade a Henry 4K Ultra, S/N 265. I have the original bill of sale, amp was built in 1982. This amp is cosmetically and electrically perfect. only defect is wattmeter needle is bent very slightly to right. meter movements are available from Henry for abt $100. goes with spare 8877. Driving with IC-746 will pin internal meter and about 3K out on coaxial dynamics wattmeter. will trade or ?. Will swap complete station, 4K Ultra and Icom IC-746, 746 purchased new in May 1999 and has less than 50 hours on it. This gear is in as new condition. I also have a homebrew pair of 8877 on 50mc. It is ugly, crude and built on used chassis, etc., but driven with the 746 it will make 3800 out on 6. Its kind of like the W6PO 2 mtr amp but uses 2 tubes and lumped inductors instead of pieces of pipe. It has 4400v, 2amp supply, Dahl 80lb plate xfmr, etc. is in junky 6ft rack. I am open to offers if any interest. Thanks, w8zh@juno.com or 440-548-4426 anytime.

Paul

There's an interesting 40A 13.8V switcher design in the '99 Handbook,
using homemade transformers. Might be in the Y2K Handbook as well, I
haven't checked.

I am interested in experimenting with 10Ghz (or higher) wideband FM equipment (build my own). Can some one tell me more about the frequency stability of these gunn diodes? How about the lifespan of them? how often do these devices have to be replaced (if ever?) Can the resonant cavities be home made (if so, where can I get the dimensional specs, where to place the components, etc)? Can anyone give input on their impressions of Advanced Reciever Research, or Hawgplexer parts/ kits/ etc? other suppliers? Brad n4trc@prodigy.net

> stability of these gunn diodes?

They are actually not that unstable, relative to the frequencies they're running at. In terms of long-term stability, temperature is key. http://www.shfmicro.com sells a "Gunn Heater" board that can be used to keep a Gunnplexer housing at a constant high temperature to improve stability, if you want to try free-running them. The diodes I've used are rated for +/- 25 MHz temperature stability over -30 to +70 C, so if you can keep the temperature constant to within a degree or two, drift shouldn't be more than a few hundred kHz worst case. That's fine for wideband video and data modes, but for NBFM work you would have to use some sort of AFC mechanism.

Haven't really looked into the residual FM and phase-noise characteristics of Gunn diodes, but I don't recall the ones I've used being too obnoxious.

> How about the lifespan of them? how often do
> these devices have to be replaced (if ever?)

I've never heard of one burning out. Considering how many millions of them you see in supermarket door openers and such, it's probably not a big deal. There are no MTBF specs on the data sheets I have, but anecdotally, I've been running two high-power (100 mW) diodes continuously since early June with no downtime.

> Can the resonant cavities be
> home made (if so, where can I get the dimensional specs, where to place the
> components, etc)?

Sure, you could do this yourself, but shfmicro.com has some very high-quality M/A-COM 10 and 24 GHz Gunn-source cavities complete with varactor and Schottky mixer diodes and tuning screws for $60-$70 apiece. Unless you're on a real shoestring budget the M/A-COM parts are the way to go IMO. Both the shfmicro site and my Ethernet-link project page (below) have data sheets for the M/A-COM parts.

> Reciever Research, or Hawgplexer parts/ kits/ etc? other suppliers? Brad
> n4trc@prodigy.net

Haven't looked into these -- do you have any URLs? I have been 100% happy with shfmicro myself, so I'm not sure what other suppliers are out

there.

There's a filter like this in the ARRL Handbook. We were discussing it a few
months ago. I don't think it matters which edition, because the first
one I ever had, from 1971, had such a filter, though not the exact same
design as the one in more recent years.

But an important thing to watch before making a filter is where the problem
lies. A filter between the antenna and the converter won't do anything
if the car radio is picking up the signals directly, due to incomplete
shielding. Other problem areas would be the cabling from the converter
to the car radio. And of course if the converter itself isn't sufficiently
shielded the same problem arises. Try it with the unpowered converter connected
to the radio, with no antenna. If the problem signals are there, then
a filter ahead of the converter won't help.

Of course, one way around this, whether the problem is coming in
from the antenna or from incomplete shielding, is to make the converter
tuneable. Back when there were plenty of commercial converters, the car
radio was fixed. It was easier to pick a locally unused frequency in
the broadcast band than to have to deal with tuning the radio across
a band where there might be strong local signals.

ME Too!!!!!!!!

I am looking for the a schematic for the Kenwood IF-232C to connect to my TS-440SAT. Finding the IC-10 chipset is not going to be a problem.

I have not looked at the Handbook yet as mentioned in another response. I have just started working on this phase of the project. There is one manufacturer on the net - http://www.apci.net/~jbi/jbikits.htm - that mentions a CW Keying option

Any and all help would be greatly appreciated. I am also going to post new message for this.

Greetings.....

The subject says it all!!! I would like to build the computer interface for my Kenwood TS-440SAT. I recently saw a posting regarding a project in the Handbook although I haven't gotten that far yet. Just started on this little venture. Also there is a manufacturer - http://www.apci.net/~jbi/jbikits.htm - that lists a CW keying feature that I might be interested in.

Anybody have any drawings laying around or have reverse engineered one of these interfaces??????

Thank You in Advance

i will check that handbook. i think its shielded ok. its completely contained in a steel box, with coax ant connections. i have put a choke in series with the power to kill rf there. this set contains a pre-amp, and the problem is only there when the power is on and the bypass switch is in the in service position.
